Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

No property damage other than aircraft. Radome, Nose and Right Main landing gear collapsed. Associated damage with gear collapse.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I departed IND at approximately 1020 am enroute to APF and it was mostly a smooth ride. Coming into Florida on the Pikkr 6 arrival, I was vectored for traffic and given multiple speed assignments. Further enroute, I was given more vectors and speed assignments then cleared to the Pohjy intersection for the full approach and instructed to maintain 170 kts until a 5 mile final. I had already received the ATIS while on the Pikkr 6, bugged ref speeds, ran check lists and flew Vref until the runway was assured and made a normal landing just past the numbers on runway 23. Upon landing, I applied the brakes and they seemed normal, but then further into the rollout they faded. I applied max braking pressure and felt the brakes hit momentarily then release then hit momentarily and release, all while I was applying max brake pedal pressure. I remembered that during training being told that the Brake application is not linear, and the majority of the stopping power comes in the last 30% (I think) of the ground roll. I also remember that you were not supposed to "pump" the brakes as it causes the anti-skid computer to "reset" and causes a delay in brake effectiveness each time the brakes are "Pumped".

The brakes never fully activated during the last portion of the roll out, even as I maintained max brake pedal pressure to the end. They would "hit" and then it felt like they fully released.

I over-ran the end of runway 23 and steered the aircraft to the right to avoid colliding with the blast barrier off the end of the runway. The nose and right main gear collapsed and I slid to a stop. I went to shut down the engines and the thrust levers were bent. I raised the flap handle to be able to grab the right engine cut off lever and shut down the right engine. The left engine thrust lever would not clear the right thrust lever, so I applied pressure to it and forced it to clear and shut down the left engine. I turned off the battery master, exited the flight deck, opened the main cabin door and assisted the passengers with egress from the aircraft. Once everyone was a safe distance from the aircraft, I returned and disconnected the main ship battery. There were no apparent fluids leaking from the aircraft.
