 ☐ Unknown

Aircraft Fire

- ☒ None ☐ Both Ground and In-Flight
☐ In-Flight ☐ Fire at Unknown Time
☐ On-Ground ☐ Unknown

Aircraft Explosion

- ☒ None ☐ Both Ground and In-Flight
☐ In-Flight ☐ Explosion at Unknown Time
☐ On-Ground ☐ Unknown

Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The aircraft has a bent right main landing gear, a collapsed nose landing gear, the propeller struck the ground causing a sudden stoppage to the engine. The cowling's damage occurred when the nose gear collapsed. The airplane came to a stop when it hit a parked Toyota Tacoma truck. It made contact with the left rear quarter panel of the truck.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Personal report on the accident (September 29, 2021, ~ 30 minutes after accident): Departure- 11:49 EDT. Departed Apopka Airport (X04) to the south for a routine discovery flight over Disney World and then returned back to Apopka Airport (X04). After getting the weather from Leesburg International Airport (KLEE) (Apopka was not reporting weather) and listening the CTAF I entered the traffic pattern for runway 15. The airplane was a little high on base-to-final, so I put the airplane into a slip. Once established back on the glidepath I took the airplane out of the slip about 300' AGL. Once the runway was made, I took the power slowly out to idle and initiated the flare. The airplane landed and then jerked to the right. I put full left rudder in to try to get the plane back on centerline. Once that did not work, I initiated full power to do a go-around so that we wouldn't take out a taxi-way light. I felt the airplane continuing to yaw to the right, so I cut the power to idle seeing that we were headed to the hangars south of the runway. To stop the airplane from hitting the hangar I applied full brakes which is when the nose landing gear collapsed. The airplane came to a stop when it hit the truck in front of the hangar.

Post-Accident: After watching the recorded video several hours after the accident (1521 local time) more details came back to me: When the normal landing was made the main landing gear touched down first and then the airplane jerked to the right. I put full left rudder in to try to get the plane back on centerline. When the airplane did not respond by turning back to the left after putting left rudder control inputs in I knew the airplane was not going to get back on centerline and possibly continue off the runway towards structures and people. When I knew we were on a vector toward the hangars I initiated full power to do a go-around so that we wouldn't take out a taxi-way light and to prevent the airplane from a runway excursion that could have led to the airplane continuing to yaw to the right towards the hangars, other aircraft and people. The video shows that once I initiated the go-around that the airplane's directional control was not coordinated. The airplane rolled hard left and I tried to go back to the right. I was unable to manipulate the flight controls from what seemed to be caused by a mechanical blockage in the control stick system to get us in a coordinated flight attitude for climb-out. When this was occurring, I looked over at my passenger and asked if they were on the controls and they replied "no." Resistance in the control stick system made it hard to correct for coordinated climb out which led the aircraft to lose vertical lift. There was no stall warning horn activated or buffeting. The airplane appears to have landed wings level back on the runway and with little chance of being able to clear obstacles (hangars) I applied full brakes as the airplane exited the runway. Even with full left rudder inputs, the airplane continued to yaw and veer to the right once it touched down. The picture taken of the aircraft (figure 1 attached) about 10 minutes after stopping shows that the rudder is deflecting all the way to the left which confirms that even though full left rudder input was made, the airplane continued to yaw and veer to the right. About 30 minutes post-accident, a witness (I believe from the other flight school at the airport) states they saw aircraft veer to the right upon landing. I made sure that my passenger was ok and after hearing that she was I turned the fuel off and ignition and then we exited the airplane normally.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)**Was there Mechanical Malfunction/Failure?** ☒ Yes ☐ No

*See attached for full report on this section

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

The main landing gear issues with the aircraft, the mechanical stoppage with the flight controls, and the stall warning horn not being activated during the inadvertent stall are what I have made notes of below:

Manufacture: Costruzioni Aeronautiche Tecnam

Main landing gear part no. "27-8-200-001/2"

Brake System part no. "27-9-200-000"

Control stick assembly part no. "24-5-500-000" specifically "92-4-301-3" and "92-4-200-2"

Stall sensor part no. "21-9-420-000"

**Total Time/Cycles
On Part**

_____ Hours

_____ Cycles

**Time Since This Part

***NTSB Transfer of Data**

Date: March 30, 2022

Made by: Leah Read, NTSB IIC

The pilot made the following comments in his 6120.1 form (page 10) under Mechanical Malfunctions/Failures; however, when the .1 form was being prepared to be placed in the NTSB Public docket for this accident, the entire entry could not be fully read. The NTSB IIC copied and pasted the pilot's entire entry into a .pdf document so it could be placed as an attachment to the .1 form in the public docket. The following is the entire entry made by the pilot:

"The main landing gear issues with the aircraft, the mechanical stoppage with the flight controls, and the stall warning horn not being activated during the inadvertent stall are what I have made notes of below:

Manufacture: Costruzioni Aeronautiche Tecnam

Main landing gear part no. "27-8-200-001/2"

Brake System part no. "27-9-200-000"

Control stick assembly part no. "24-5-500-000" specifically "92-4-301-3" and "92-4-200-2"

Stall sensor part no. "21-9-420-000"

I have multiple witnesses for actions. I have had an issue manipulating the flight controls before on the ground while doing a run-up on previous flights with the same aircraft, same model aircraft, and another model aircraft. After adjusting my seat on a previous flight, the problem seemed to go away. It felt like there is a physical part preventing me from putting in control inputs, which I could feel under my seat. The following is knowledge previously known about the aircraft:

-Aircraft parking brake locking up on landing.

-A student pilot declared an emergency in the aircraft on rollout approximately two weeks before because of parking brake locking up during landing. The student pilot declared the emergency over the CTAF frequency while my co-worker and I were listening to the handheld radio during our lunch break.

-Maintenance switched parking brake direction in cockpit; wheels locked-up on several occasions during landing.

Maintenance Issues on Aircraft and Similar Models at First Landings Flight School:

June 24, 2021: P92/ N577TU (same model, different tail-number) Landing gear collapsed at Orlando North Airport on landing.

September 7, 2021: P92/ N615TA Parking brake locked up on landing at FA83 (Orlando North Airport).

September 15, 2021: P92/ N615TA Parking brake locked up on landing at X04 (Apopka Airport).

September 2021: P92/ N615TA Pilot, Angel Rosa, declared emergency over CTAF on runway 15 at X04 (Apopka Airport) after parking brake locked up during landing roll-out.

September 27, 2021: P92/ N19AA Adjusted seat and felt flight controls resisting. Different tail number, but same model aircraft.

September 29, 2021: Staff meeting. Discussed parking brake issues on N615TA at 0730 local time. Mechanic did not resolve issue before my flight at 1000.

November 26, 2021: P92/ N19AA (Same model, different tail-number) First Landings aircraft went off runway at X04 (Apopka Airport) and hit a hangar. I do not know the cause, but the aftermath seems similar to what happened with N615TA on September 29, 2021."
