Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Tail assembly was knocked off the gyro's keel. All three propeller blades were damaged. No property or other aircraft were damaged.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On 11 June 2022 I was flying children as part of our local EAA 857 chapter's Young Eagle event. I was preparing to fly my fourth passenger of the day at about 1230 local. We would be departing on BTP's runway 26. The wind was just left of centerline; perhaps 220 at 5 knots. It was a warm, beautiful, clear day and the runway conditions were dry. I pre-rotated my rotor blades as usual but as I began my takeoff roll they struck both the tail assembly and propeller blades. The aircraft veered to the left and we departed the runway. By the time I got the engine off and gyro stopped we were about 100' into the grass on the left side of the runway; perhaps 200' beyond the numbers. My passenger and I remained in the gyro while the blades spun down and stopped. We both exited the aircraft. Neither of us suffered any injuries.

Several EAA chapter members and FBO staff soon arrived. My passenger was walked back to his parents while I remained with the FBO staff to remove two large tail pieces from the runway and walk it for any remaining small debris. The brakes and landing gear were undamaged so the FBO staff towed the gyro back to a community hangar with me in it for steering and braking. There I removed the two rotor blades. A local man with a trailer helped me transport the gyro, rotor blades and fiberglass tail components back to my hangar at PJC (Zelienople) by about 1530 local.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I'm no accident investigator but it seems clear to me that a higher pre-rotation speed would have helped keep the rotor blades/disk more rigid and thus reduced the likelihood of them striking the tail and propeller. Although I don't typically pre-rotate before entering the runway, it was busy at the airport this day so I did begin pre-rotation while rolling out into position. Although I recall seeing 140 rpm on the rotor disk before beginning my takeoff run, which is above the recommended 120 rpm for maintaining a stiff rotor disk during takeoff, I don't typically like to slam on the power with kids on board. The rotor speed may have decayed during that power ramp up, opening the door to blade flap due to wind or control movement. If I had a "do over" I would not have pre-rotated until in place and I would have waited for about 160 rpm before beginning my takeoff roll.
