Senior Air Safety Investigator
AS-ERA

Date: 4/27/2023

Subject: ERA23FA209, Weather Data

The following factual weather data were provided by NTSB Meteorologist Donald Eick:

Data Requested

Synoptic Conditions - The NWS Surface Analysis Chart for 1400 EDT with a basic topographic chart is included as figure 1. The chart depicted a low-pressure system with a central pressure of 1013-hectopascals (hPa) over southern Mississippi along a stationary front that extended eastward over southern Alabama and Georgia, and then northeastward along the Georgia and the South Carolina Atlantic coast. A high-pressure system with a central pressure of 1022-hPa was located over the western South Carolina and North Carolina border, with a ridge extending westward over northern Georgia and Alabama, and Tennessee. A cold front was depicted north of the high extending from Virginia into Tennessee. The accident site was located in the cool airmass between the two fronts and south of the high-pressure ridge. The station models surrounding the accident site depicted northeasterly winds of 10 knots or less, broken to overcast cloud cover, with temperatures in the mid to upper 50's to low 60's degrees Fahrenheit, with several stations over northern and western Georgia, Northern Alabama, western South Carolina, and Tennessee reporting light rain.

A close-up of the National Composite Radar Mosaic for 1430 EDT over the area is included as figure 2 with the accident site marked by a red star. Several scattered areas of echoes were depicted over northern Georgia, with the accident site and the destination airport KWDR located within an area of echoes of 30 dBZ or less.

Observations - The area surrounding the accident site was documented using official Aviation Routine Weather Reports (METAR) and Aviation Selected Special Weather Reports (SPECI). Cloud heights are reported above ground level (agl) in the following section, and the magnetic variation was estimated at 6° west based on the latest sectional chart for the area.

The accident airplane's planned destination was Barrow County Airport (KWDR), Winder, Georgia, which was located 15 ½ miles west-northwest of the accident site, at an elevation 934 ft. The airport had an Automated Weather Observation System (AWOS), which issued observation by radio on 118.575 VHF, and disseminated observations longline every 20-minutes to users nationally.

No TAFs issued for the station.

Athens/Ben Epps Airport (KAHN), Athens, Georgia, was located about 7 miles northeast of the accident site and

about 17 miles east of KWDR, at an elevation of 812 ft. The airport had an ASOS system and whose observations were augmented by tower personnel. The following conditions were reported at the time of the accident.

Special weather observation for KAHN at 1359 EDT, wind from 050° at 10 knots gusting to 17 knots, visibility 10 miles or more, ceiling broken at 1,200 ft agl, overcast at 2,100 ft, temperature 56° F (13° C), dew point temperature 52° F (11° C), and altimeter setting 30.13 inHg. Remarks: automated station with a precipitation discriminator, temperature 13.3° C, dew point 11.1° C.

The general flight conditions and raw observations in standard METAR format were as follows from about 0800 through 1600 EDT.

A depiction of the NWS Aviation Weather Center's METAR display for 1430 EDT with the approximate accident site marked and the general flight categories reported at the surrounding stations is depicted in figure 3.

Sounding - A High-Resolution Rapid Refresh (HRRR) numerical model was obtained from the NOAA Air Resources Laboratory website for the closest grid point to the accident site for 1400 EDT. The model sounding was then plotted on a standard Skew T log P diagram using the RAOB Analysis software and is included as figure 4. The HRRR sounding over the accident site for 1400 EDT indicated an elevation of 728 ft with a near surface temperature of 15.1 C (59 F), a dew point temperature of 12.5 C (54.5 F), with a density altitude of 854 ft. The lifted condensation level (LCL) and level of free convection (LFC) were identified at 1,079 ft agl, with the convective condensation level at 4,562 ft agl. The sounding was saturated from the LCL through 15,000 ft, with the freezing level identified at about 10,000 ft. The precipitable water content was 1.05 inches. The Lifted Index was 2.9 and the K-Index was 29.6 and indicated a conditionally unstable atmosphere supporting rain showers.

The HRRR wind profile indicated a surface wind from 040 at 8 knots, with winds veering to the south and southwest above 4,000 ft with increasing winds speeds with height and continuing to veer to the west. The mean 0 to 6 kilometer (or 18,000 ft) wind was from 265° at 20 knots.

A table of the HRRR sounding data of height, pressure, temperature, dew point temperature, relative humidity, wind direction and speed, and RAOB derived Clear Air Turbulence (CAT) and Low-Level Wind Shear (LLWS) potential below 8,000 ft were as follows.

Height (ft msl)	Pres (hPa)	T (C)	Td (C)	RH (%)	Wind (dir/kts)	CAT (FAA)	LLWS (FAA)
728		994	15.1	12.5	84 041/ 8		
756		993	14.6	11.6	82 041/ 8		LIGHT

Satellite Imagery - Animation attached.

Weather Radar Imagery - the closest NWS Atlanta Weather Surveillance Radar 1988 Doppler (WSR-88D) is attached below for 1421 and 1427 EDT (figures 5 and 6) with the flight track overlaid for the period in magenta. The track of N123CD enters into an area of echoes of 10 to 25 dBZ, when the aircraft abruptly spirals into the ground.

NWS Forecasts and Advisories

Graphic Forecast for Aviation (GFA) - the NWS GFA 3-hour Surface and Cloud forecasts issued 1200 EDT and valid for 1400 EDT are included as figures 7 and 8 respectively. The forecasts depicted an area of low visibilities over northern Georgia with a change of rain showers, while the cloud forecast indicated scattered to broken clouds with bases near 4,500 ft msl with tops near 12,000 ft. G-AIRMETs for mountain obscuration and icing conditions above 10,000 ft (not a factor) were also depicted. The GFA cloud forecast missed the MVFR to IFR conditions ceilings over the area.

In flight Weather Advisories - The NWS had no SIGMETs, Convective SIGMETs, or Center Weather Advisories current during the period surrounding 1200-1430 EDT. NWS did have G-AIRMET current for IFR and mountain obscuration conditions (figure 9).

Astronomical Conditions - The astronomical conditions for April 26, 2023 for Winder, Oconee County, Georgia was as follows.

	<u>Local</u>	<u>UTC</u>
Morning civil twilight	06:25	10:25
Sunrise	06:52	10:52
Sunset	20:13	00:13
Evening civil twilight	20:40	00:40
