

NATIONAL TRANSPORTATION SAFETY BOARD

NTSB Form 6120.1

PILOT/OPERATOR AIRCRAFT ACCIDENT/INCIDENT REPORT

Email the pilot/operator aircraft accident/incident report to the investigator-in-charge of your accident/incident. If email is not available, mail the report per the instructions below.

If your accident/incident occurred in Maine, Vermont, New Hampshire, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Maryland, Delaware, Virginia, West Virginia, Kentucky, Tennessee, North Carolina, South Carolina, Mississippi, Alabama, Georgia, Florida, the District of Columbia, Puerto Rico, or the US Virgin Islands, send the form to: NTSB, ERA, 45065 Riverside Parkway, Ashburn, VA 20147.

If your accident/incident occurred in Ohio, Michigan, Indiana, Wisconsin, Illinois, Minnesota, Iowa, Missouri, Arkansas, Louisiana, North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, Texas, Colorado, or New Mexico, send the form to: NTSB, CEN, 4760 Oakland Street, Suite 500, Denver, CO 80239.

If your accident/incident occurred in Montana, Wyoming, Idaho, Utah, Arizona, Nevada, Washington, Oregon, California, Hawaii, or the territories of Guam or American Samoa, send the form to: NTSB, WPR, 505 South 336th Street, Suite 540, Federal Way, WA 98003.

If your accident/incident occurred in Alaska, send the form to: NTSB, ANC, 222 West 7th Avenue, Room 216, Box 11, Anchorage, AK 99513.

Rules pertaining to notification of aircraft accidents and incidents, as well as overdue aircraft are found in 49 Code of Federal Regulations (CFR) Part 830 http://www.ecfr.gov/cgi-bin/text-idx?c=ecfr&tpl=/ecfrbrowse/Title49/49cfr830_main_02.tpl. These rules state the authority of the NTSB, define accidents, incidents, injuries, and other terms, and provide procedures for initial and immediate notification of accidents and incidents by aircraft pilots/operators.

A. APPLICABILITY

The pilot/operator of an aircraft shall send a report to the office listed above, based on accident/incident location; immediate notification is required by 49 CFR 830.5(a). **The report shall be filed within 10 days after an accident for which notification is required by Section 830.5, or after 7 days if an overdue aircraft is still missing.**

An aircraft accident, as defined in 49 CFR 830.2, is determined as an occurrence that involves a fatality or serious injury, or substantial damage to the aircraft. For occurrences that do not involve a fatality, the determination that the occurrence is an accident can be appealed by writing to the Director, Office of Aviation Safety, NTSB, 490 L'Enfant Plaza, S.W., Washington, D.C. 20594.

INSTRUCTIONS TO PILOTS/OPERATORS FOR COMPLETING THIS FORM

It is necessary that ALL questions on this report be answered completely and accurately.

If more space is needed, continue on a blank sheet of paper.

Nearest City/Place: Use the name of the nearest community in the state where the accident/incident occurred.

Date/Time: Indicate the date and local time of the event. Be sure to indicate the time zone.

Phase of Operation: Indicate the phase of operation during which the accident/incident occurred.

Aircraft Information: Enter aircraft make and model information as indicated on the aircraft registration certificate, including series. If the involved aircraft is certified as "amateur-built," include the name of the producer of the kit or plans, unless an NTSB employee instructs otherwise.

Maximum Gross Weight: Enter the certificated maximum gross weight for the aircraft involved in the occurrence. This should be the same as the maximum gross weight indicated on the aircraft weight and balance documents.

Engine: Enter engine make and model information as indicated on the engine data plate.

The NTSB uses this form for aircraft accident prevention activities and for statistical purposes. NTSB regulations (49 CFR Part 830) require that **ALL** questions be answered completely and accurately. Completion of this form will take approximately 60 minutes. The NTSB does not guarantee the privacy of any information provided in this form. You need not complete this form unless it displays a valid OMB control number, in accordance with 5 C.F.R. § 1320.5(b), which applies to this collection of information.

B. DEFINITIONS

1. "Aircraft Accident" means an occurrence associated with the operation of an aircraft that takes place between the time any person boards the aircraft with the intention of flight and all such persons have disembarked, and in which any person suffers death, or serious injury, or in which the aircraft receives substantial damage. For purposes of this form, the definition of "aircraft accident" includes "unmanned aircraft accident," as defined at 49 CFR 830.2.

2. "Substantial Damage" means damage or failure that adversely affects the structural strength, performance or flight characteristics of the aircraft, and that would normally require major repair or replacement of the affected component. NOTE: Engine failure or damage limited to an engine if only one engine fails or is damaged, bent fairing or cowling, dented skin, small puncture holes in the skin or fabric, ground damage to rotor or propeller blades, and damage to landing gear, wheels, tires, flaps, engine accessories, brakes, or wing tips are not considered "substantial damage" for purposes of this report.

3. "Operator" means any person who causes or authorizes the operation of an aircraft, such as the owner, lessee, or bailee of an aircraft.

4. "Fatal Injury" means any injury that results in death within thirty (30) days of the accident.

5. "Serious Injury" means any injury that (1) requires hospitalization for more than 48 hours, commencing within 7 days from the date the injury was received; (2) results in a fracture of any bone (except simple fracture of fingers, toes, or nose); (3) causes severe hemorrhages, nerve, muscle, or tendon damage; (4) involves injury to any internal organ; or (5) involves second- or third-degree burns, or any burns affecting more than 5 percent of the body surface.

Type of Fire Extinguishing System: If a fire extinguishing system was used to fight an aircraft fire, specify the type(s) of extinguishing system(s) used. Examples include handheld extinguisher, engine fire bottle, cargo/baggage compartment fire suppression system, or airport emergency ground equipment.

Owner/Operator Information: Enter the owner information as shown on the registration certificate. Commercial operators, enter the operator information, including "doing business as" when applicable, as shown on the operator certificate.

Revenue Sightseeing Flight: Indicate whether the accident aircraft was conducting revenue sightseeing operations under 14 CFR Part 91 at the time of the accident.

Air Medical Flight: Indicate whether the accident flight was being conducted for the purpose of carrying medical personnel, patient(s), or organs.

Public Aircraft: Federal, state or local government flight operations such as official travel, law-enforcement, low-level observation, aerial application, firefighting, search and rescue, biological or geological resource management, or aeronautical research. Indicate whether the flight was conducted by the armed forces, federal, state, or local government.

Purpose of Flight: 14 CFR Parts 91, 103, 133, 136, and 137: Indicate the type of operation that was being conducted at the time of the occurrence using the following definitions:

AERIAL APPLICATION--Operations using an aircraft to perform aerial application or dispersion of any substance. Examples include agricultural, health, forestry, cloud seeding, firefighting, insect control, etc.

AERIAL OBSERVATION--These flights include aerial mapping/photography, patrol, search and rescue, hunting, highway traffic advisory, ranching, surveillance, oil and mineral exploration, criminal pursuit, fish spotting, etc.

AIR DROP--Aerial operations, other than aerial application, that are intended to release items in flight.

AIR RACE/SHOW--Includes any flight operations conducted as part of an organized air race or public demonstration.

BUSINESS--includes all personal flying without a paid professional crew for reasons associated with furthering a business, including transportation to and from business meetings or work. This does not include corporate/executive operations, air taxi, or commuter operations.

EXECUTIVE/CORPORATE--Company flying with a paid, professional crew.

FERRY--Non-revenue flight under a special flight or "ferry" permit. Refer to 14 CFR 21.197 for details of special flight permit issuance.

FLIGHT TEST--Flight for the purpose of investigating the flight characteristics of an aircraft/aircraft component or evaluating an applicant for a pilot certificate or rating.

INSTRUCTIONAL--Flying while under the supervision of a flight instructor or receiving air carrier training. Personal proficiency flight operations and personal flight reviews, as required by federal air regulations, are excluded.

OTHER WORK USE--Miscellaneous flight operations conducted for compensation or hire such as construction work (not 14 CFR Part 135 operation), parachuting, aerial advertising, towing gliders, etc.

PERSONAL--Flying for personal reasons (excludes business transportation) including pleasure or personal transportation. This also includes practice or proficiency flights performed under flight instructor supervision and not part of an approved flight training program.

POSITIONING--Non-revenue flight conducted for the primary purpose of relocating the aircraft. Examples include moving the aircraft to a maintenance facility or to load passengers or cargo etc.

UNKNOWN--Use only if the primary purpose of flight is not known.

Other Aircraft--Collision: For all accidents involving a collision with another aircraft, including parked aircraft, check "Collision with other aircraft" under Basic Information and complete this section indicating details about the OTHER aircraft involved in the collision.

Airport Information: Complete this section if the accident/incident occurred on approach, landing, takeoff, departure, or within 3 statute miles of an airport. Please refer to the FAA Airport/Facility Directory or other official source for airport information.

Airport Identifier: Provide the official 3 or 4 character airport identifier number.

Runway: Indicate the number of the runway used, including L, R, or C if applicable.

Runway/Landing Surface: Indicate the type of intended runway/landing surface (do not indicate surface conditions). If the surface type was mixed, check all that apply.

Condition of Runway/Landing Surface: Indicate the condition of the intended runway/landing surface. If multiple conditions existed at the time of the accident, check all that apply.

Weather Information at the Accident/Incident Site: Indicate the weather conditions reported at the accident/incident site at the time of occurrence. If no weather reporting was available for the accident/incident site, indicate the reported conditions at the nearest reporting site. Specify the weather reporting site identifier, the observation time, and distance from the accident/incident.

Sky/Lowest Cloud Condition: Indicate the height above ground level of the lowest cloud condition present at the time of the accident/incident and whether coverage was reported as few, scattered, broken or overcast. Also indicate the height above ground level and coverage of the lowest cloud ceiling present at the time of the accident/incident (reported as broken or overcast).

NOTAMS (D and FDC), AIRMETs, SIGMETs, PIREPs: Describe all NOTAMS (distant (D) or Flight Data Center (FDC), if known), AIRMETs, SIGMETs, and PIREPs in effect near the accident/incident.

Flight Crewmember Information: Indicate the category that best describes the capacity served by this flight crewmember at the time of the accident. The designators "Flight Crewmember 1" and "Flight Crewmember 2" do not refer to a specific pilot position or responsibility. If more than one pilot is aboard, they may be entered in any order and their capacity entered as appropriate.

Degree of Injury: See Definitions on the top half of Page 1 of the instructions. Minor injury is not defined. If an injury does not meet the criteria for another injury category, select Minor.

Date of Last Flight Review or Equivalent: Enter the date of the most recent flight review, or equivalent, completed by this pilot. Refer to 14 CFR 61.56 for accepted equivalents.

Type Ratings: List all type ratings on the pilot certificate. If the pilot holds no type ratings indicate "none." If the pilot holds a pilot certificate other than student and was flying an aircraft requiring an endorsement, enter the type and date of any logbook endorsement(s) for that aircraft. See 14 CFR 61 for examples of required endorsements.

Student Endorsements: If the pilot holds a student pilot certificate, enter all solo endorsements and dates on the student pilot certificate.

Flight Time: Complete the flight time matrix. Solo flight time should be included as "Pilot-in-Command (PIC)" and all dual flight instruction given should be included as "Time as Instructor."

Additional Flight Crewmembers: Complete this section if there were more than two required flight crewmembers on the aircraft. This also includes a check airman performing official duties but does not include cabin crew. State the capacity served by each included crewmember at the time of the accident.

Passenger(s)/Other Personnel: Enter identification and injury severity information for all passengers, cabin crew, and other personnel involved in the accident. See Page 1 of the instructions for the official definition of injury levels.

Several questions throughout the form allow for multiple responses; when appropriate, choose all responses that apply.

These instructions only pertain to major issue areas covered by NTSB Form 6120.1 Pilot/Operator Aircraft Accident/Incident Report. For additional definitions of questions and responses, please refer to www.nts.gov.

Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Main and tail rotor blades bent, requires replacement. Main skids slightly bent from the resting angle of the helicopter post impact and requires replacement.
Sheet metal on the tail cone adjacent to the tailcone-fuselage boundary slightly torn due to side loads on tail cone at the helicopter's resting angle post impact.
Left door window cracked due to resting angle of helicopter post impact on its left side.
Slight leakage of main rotor gearbox oil from the oil vent on the main rotor mast.
No damage to other property.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The incident helicopter started up at about 1130 Eastern standard time. The crew received ATIS information Echo and called Republic Ground for taxi clearance to G3 with a south east departure. Republic Ground gave the taxi clearance and informed the crew to contact tower when ready for departure. The crew noticed the windsock shows wind direction around 090-100 magnetic, so decision was made to takeoff to the south parallel to Runway 19 due to less obstacles and no opposite landing/departing traffic on the runway (the active runway was Runway 1 at the time).

The student is the pilot flying on this takeoff and departure. On climb-out past approximately 300 feet above mean sea level, the instructor suggested a turn east to avoid overflying helicopter traffic landing at the numbers of Runway 32, to which the student pilot agreed and flew. Once clear, the student turned south east, visually aiming for Bergen Point Golf Course. Approaching shoreline, the instructor directed the student to turn right towards Cedar Island to practice quick stop maneuvers. The crew continued to monitor the Republic Tower frequency on 118.800 MHz in case of traffic on right base to Runway 1 or traffic coming into Runway 32.

The crew judged the wind was coming from the east and turned west to enter a downwind for a left traffic pattern to Cedar Island. Ground speed was visually determined to increase after the turn downwind, confirming that winds are approximately from 090 magnetic in the area. The student flew an approach to a hover over Cedar Island and proceeded with 2 quick-stops facing east along the marsh.

After quick-stops, the instructor directed the student to takeoff to the east and do another left pattern to Cedar Island for a straight in autorotation to a hover from 600 feet above mean sea level indicated. The student used proper cyclic and pedal input to maintain the target 65 knots indicated air speed in the autorotation but slightly overcorrects collective inputs for the target RPM initially, the instructor verbally guides the student's inputs and RPM is stabilized by 300 feet above mean sea level indicated. The student terminates the maneuver in a hover and the instructor made a few comments before the student took off for another left traffic pattern to Cedar Island for more autorotations. The student uses smaller collective correction this time, improving RPM control and terminates maneuver in a hover.

After 1 more pattern with a straight in autorotation, the student took off to the East to overfly Fox Island to survey the clearing and prepare for landing there for hover work. The crew made a left traffic pattern to set up for landing on Fox Island. Winds are confirmed to be steady from the East, approximately 15 knots, visually judging from the crab angle in the pattern and apparent ground speed. The time since startup when turning final for Fox Island was 45 minutes reading from the stopwatch on the instructor's watch.

The student terminates the approach in a hover and then sets down on a sandy patch on Fox Island. He then picks up and hover taxis to another sandy patch to practice power failures in a hover. After setting down on the new spot and determining surface flatness, firmness and wind condition, the student picks up to a hover to practice power failures in a hover. The instructor verbally confirms skids are clear and verbally recites the control inputs required for the maneuver to which the student confirms correctly.

The student hovers at approximately 3ft above ground level, heading approximately East, and then smoothly rolls off throttle and uses pedals to maintain heading within 10 degrees and the helicopter settles on the spot with no lateral drift. Instructor compliments the pedal and cyclic coordination and recommends using some more collective to cushion the touchdown.

The Instructor rolls the throttle back up, lets governor control the throttle and picks up into a hover to demonstrate one power failure in a hover. Instructor rolls off throttle, applies right pedal and cyclic and uses more collective just before touchdown to cushion the landing. The student feels the collective movement with his left hand during the demonstration. The student rolls the throttle back up and lifts helicopter into a hover at approximately 3 feet above ground level. The student counts down from 3 to the initiation of his simulated power failure practice. The student rolled throttle off and applied right pedal and cyclic, holding heading constant. At approximately 1-2 feet above ground level, a wind gust from the starboard side of the helicopter caused a left roll and left drift.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Avoid practicing power failures over same spot repeatedly over a period of several months as skid impact wears away the ground surface, creating a bowl of soft sand which is more probably to catch a skid sliding on with lateral motion. Paved surfaces or compact dirt/grass would be surfaces are safer for power failure practice.

Hover taxi in the area 100 feet around the power failure practice spot to feel for any gusts, turbulence or variable wind direction. If these are detected, pick a different spot for power failure practice or practice the maneuver on a different day with more favorable wind conditions.

Avoid practicing power failures if the wind felt at 500AGL, compared to the surface is different by more than 10 knots or 30 degrees direction to reduce the chances of a sudden wind gust or wind shift. This recommendation is for the R22 type which is sensitive to winds during power failure practices.

Set more conservative wind limits for students who are not yet showing consistency in performing emergency maneuvers.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)

Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Other Services, if Any, Prior to Departure**EVACUATION OF AIRCRAFT**

Was an emergency evacuation of the aircraft performed? ☒ Yes ☐ No

Method of Exit – Describe how the occupants exited and how many occupants evacuated each location

Instructor unbuckled seatbelt and stood on left door, assists student standing on left door before unbuckling student's belt. Instructor opens right door and climbs up and out over the roof side of the helicopter. Afterwards, instructor assists student climbing out the right door. Both occupants exited through the right door which opened normally. The left door is obstructed by the ground below due to the angle the aircraft came to a rest at.

ADDITIONAL INFORMATION (Please type or print in ink)

Use this space if additional space is needed for any answers.

Narrative history of flight continued

Instructor notices the gust and takes control, applying right cyclic to level the helicopter's attitude. The left bank was decreasing when the left skid impacted the ground with the helicopter drifting left. The helicopter started yawing right and started a rapid left roll. The instructor applied right cyclic and lowered the collective quickly. The left roll rate decreased, but the left bank angle increased to a point that the main rotor blades impacted the ground.

The helicopter continues a left roll and right yaw until coming to a rest on its port side on a southerly heading. The instructor glances to check student is ok and gets a verbal confirmation. He then proceeds to switch off the battery and alternator switches and reaches behind to rotate the fuel shutoff valve and then pulls the mixture to idle cutoff and turns the ignition key to off and removes it from the key slot. The engine is confirmed to have stopped from the silence inside the helicopter.

The instructor looks for no signs of fire and unbuckles his seatbelt, before assisting the student in standing on the port door and unbuckling the student's seatbelt. Instructor reaches up to starboard door and opens the latch, looking out to confirm no signs of fire and climbs out before assisting the student getting out. Instructor grabs fire extinguisher from the helicopter then the student and instructor grabs their coats from storage compartment beneath the seats. Both proceed approximately 20 feet east of the helicopter to observe for no signs of fire and danger.

The instructor calls the operator on the phone to inform of the incident and takes shelter from the wind chill with the student by some bushes. After several minutes, instructor proceeds to the helicopter to confirm fuel valves, battery and alternator are actually off and retrieves own and student's headset and kneeboards from the helicopter.

Some time later, a Suffolk Police Department helicopter arrives at the site and orbits the island several times. The instructor and student stands clear on the side, remaining visible and staying clear of possible landing areas for the Suffolk PD helicopter. The Suffolk PD helicopter lands and shuts down, the instructor informs the Suffolk PD pilot that all occupants are accounted for, uninjured and that no fires have been observed by the helicopter.

The Suffolk PD pilot offered to ferry the incident helicopter's crew back to their home base at Republic Airport which they accepted. The Suffolk PD pilot inspected the incident site to confirm the status of any fluid leaks or dangers on site. The instructor and student pilot gave their identification and contact information to the Suffolk PD pilot.

The Suffolk PD pilot, instructor and student took off shortly after from Fox Island on the Suffolk PD helicopter and flew back to Republic Airport. The instructor recalled being back at the Modern Aviation FBO at Republic Airport around approximately 1315 Eastern standard time.
