Accident 4/6/24

KCLE ATIS heard. Wind 350@5.

Cleared into Bravo (CLE) for practice ILS 06L. Directed to BETLL at 3000. Autopilot set to approach mode.

After BETLL crossed, dropped gear (3 green) and flaps to approach, performed GUMPS pre landing checklist.

Switched to tower per ATC.

Flew stabilized approach (airspeed between 110-120) on established 06L ILS — full flaps about a mile out.

Airspeed lowered to near 90.

Received clearance to land and "caution wake turbulence due to CRJ departure" — no instructions to go around or delay landing.

On glideslope — onboard LIDAR callouts started down to 20 then 5 heard as flare was started.

At this point the aircraft was violently pushed downward forcing hard impact on Mains which rocked to nosewheel harshly.

Tried to go around by advancing throttle to full but though a response from engine, no response from aircraft.

Two more severe bounces which mimicked porpoising until complete stop on nose — felt my back snap.

Smoke entered cabin and flames seen under nose. Unbuckled harness and crawled out onto angled wing to open passenger door and extracted my wife. We crawled/ ran to grass infield and stayed low in case of explosion.
