Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Nose wheel detached; firewall damaged; prop strike; wing tip damage; wheel pants damage; some warping in fuselage reported. Some of the damage to the fuselage and underbelly occurred during the process of moving the damaged plane to another location on the field in Shelter Island, NY, and from there to a repair facility in MA.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Description of incident, August 22, 2024, at NY03, Klenawikus Airfield, Shelter Island, N.Y.

August 17. Called NY03 management person for permission to visit. Received emailed confirmation "cleared for operations at NY03—landing permission request granted." I had flown at that field two years ago, without problems. I had received instructions from the airfield representative at that time, in advance.

Flight planning:

August 21, instructed BAC to fuel each tank to 25 gallons each tank (out of 40) to keep weight down, due to the short runway at Klenawikus'. I calculated fuel usage of 13 gallons each way, to be conservative, so as to arrive back with 26 gallons.

August 22 – day of flight:

I Checked the METAR and the Forecast via Foreflight; the weather was forecast to remain VFR for the day, 6+ miles visibility with winds from the North .

My preflight confirmed the plane had 25 gallons in each tank.

We departed DXR at 11:22, and requested and received flight following. I also listened to ATIS from New Haven. Upon reaching the North Fork, ATC canceled flight following. Listened to AWOS East Hampton. From there, we proceeded to NY03. I announced our position on commencing 5 miles out. There were no other planes in the pattern. I circled the field to observe windsock which indicated a northerly wind.

I set flaps to 10 degrees on downwind; 20 degrees on base, and 40 degrees on final.

On final. I reduced my speed to slightly below 70 MPH, as there was slight to moderate turbulence on final to runway 2. Upon crossing the trees at the approach threshold, I throttled back to idle. I anticipated a decrease in wind speed on short final as there were tall trees at the threshold as well as to the right and left of the runway.

Per POH, landing distance over 50-ft obstacle is 1350 ft. The runway length was 1700. Unfortunately, the plane floated further than I expected, and we touched down approximately one-third of the way down the runway.

I had considered executing a go-around, but decided against it, as I felt a go-around was too risky in view of the tall trees at the end of the runway. I applied heavy brakes after touching down, and although we had slowed down considerably, we passed the end of the runway and the nose-wheel collapsed upon encountering a ditch.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

In variable wind, avoid short field landing in fields without safe go-around. When I landed, the wind must have shifted, and the narrow runway between the trees might have also affected the wind. I suggest placing a windsock also on the southerly end of the runway. Also, although I have flown mostly from short grass fields for most of my flying career, I have agreed with my flight instructor to take further instruction for short field operations.
