Description of Damage to Aircraft and Other Property (Use additional sheet, if necessary.)

Collapsed main gear and nose wheel. Nose wheel collapse resulted in lower nose cone damage and damage to forward cockpit floor.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

After extended warmup, taxiway A to run up area; run up normal, completed preflight checks (no written checklist). Taxied to runway 35, announced intention to depart on CTAF (122.7) and remain in pattern. Takeoff and initial climb out normal. Cleared the departure end of runway 35 on runway heading at approximately 1,100 feet MSL. Initiated a left turn to a crosswind heading at which time the cockpit access panel unlatched from the forward access panel and partially opened creating significant noise and buffeting which affected aircraft stability and directional control. Attempting to reach and secure the access panel while also trying to stabilize the aircraft resulted in series of left banking turns in the vicinity and to the west of the departure end of runway 35. Attempts to re-establish a level flight attitude in a generally downwind direction were not successful as the aircraft appeared inclined to continue in a left bank descending turn and was unresponsive to countering control inputs. The number of circular maneuvers completed in through this upset is unclear although witness statements from observers on the ground suggested that at least several full circuits were completed.

The loss of altitude and inability to establish level controlled flight in alignment with either of the available runways ultimately resulted in my decision to attempt a landing somewhere within the expanse of open field beyond and off the westerly side of runway 35. Continuing in the left banking turn in a power on descent it appeared I would overshoot the more desirable position and be heading towards airport improvements, buildings, vehicles and/or the airport perimeter fence. Throttling back to power off at an estimated twenty +/- feet above the ground resulted in a generally wings-level attitude and a I affected a mushing stall to ground contact comfortably short of contact with the perimeter fence after an estimated distance of about 150 feet based upon skid marks along abandoned pavement from the point of initial wheel contact to the aircraft at rest.

There were no injuries to any persons or property other than the aircraft damages described above. No fire, fuel or oil spill or leakage occurred. Public safety personnel were contacted by airport personnel as were appropriate state and federal authorities.

OPERATOR/OWNER SAFETY RECOMMENDATION (How could this accident/incident have been prevented?)

Improved cockpit access panel latching mechanism.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
