OPERATOR/OWNER SAFETY RECOMMENDATION *(How could this accident/incident have been prevented?)*

Summary: The incident occurred as a result of a departure stall at approximately 50 feet following a simulated loss of engine power on takeoff. The stall was provoked due to a failure to reduce the aircraft's angle of attack. The stall was further perpetuated by cross control of the aircraft between the instructor and the pilot-in-command after the instructor initiated the transfer of controls by stating, "I have the aircraft...I have the aircraft...". The instructor was attempting to perform the "Stall Prevention and Recovery" procedure as prescribed by FAA Advisory Circular 120-109A, while the PIC was simultaneously providing cross control and attempting to raise the angle of attack in an apparent attempt to extend the aircraft glide performance. The aircraft made ground contact as a runway excursion on the right side of the runway while bouncing back airborne (while under full power). The instructor again stated, "I have the aircraft, go around". A secondary stall was induced when the PIC retarded the engine throttle to idle, while continuing to provide cross control of the aircraft from the instructor, while inquiring, "should we land"? The aircraft impacted the runway/ground a second time resulting in a nose wheel collapse.

Prevention Recommendation: The incident could have been prevented by exercising a prompt positive transfer of aircraft control to the instructor.
