☐ On-Ground ☐ Unknown

Description of Damage to Aircraft and Other Property *(Use additional sheet, if necessary.)*

Having landed with the landing gear retracted, there was substantial damage to the underbelly of the plane. The flaps were extended prior to landing, and they absorbed a great deal of damage. We tried to prevent any unnecessary damage to the engines by feathering the propellers prior to landing.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink.)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On January 10th, 2025, I was flying with FAA Examiner [REDACTED] during my CFI-MEL add-on practical test. The flight started with a normal takeoff at KPMP and a departure to the northwest. I raised the gear after a positive rate of climb, and we departed to the northwest. After climbing to 4500' and established in the practice area, we completed the required tasks of the practical test, which included steep turns, slow flight, a power-off stall, Vmc demonstration, drag demonstration, engine shutdown and restart, and emergency descent. Some of these maneuvers required the extension and retraction of the landing gear, and we had no issues. After completing these maneuvers, we headed back to KPMP to complete a normal landing, a short-field takeoff, a short-field landing and a single-engine approach and landing. The normal landing, short-field takeoff and short-field landing went well and we had no issues extending and retracting the landing gear. Then, while turning base to RWY 10 during my single-engine approach and landing, I extended the gear, and received two green light annunciations on the landing gear lights, but the right main gear would not illuminate. The gear warning horn sounded and we knew we had a problem. We initiated a go-around and retracted the landing gear, and both annunciator lights turned off. We then tried extending the gear, and still received only two annunciator lights. Realizing that we needed to troubleshoot, we departed the airspace to the northwest and began working on a solution. Over the next hour and a half we attempted to cycle the landing gear countless times, pull the emergency gear extension knob and use gravity to let the gear fall, but the right main gear would not budge. We were communicating with American Flyers as well as KPMP ATC to figure out a plan of action. After burning off most of our fuel, and verifying with KPMP ATC that the right main gear was barely sticking out from under the wing, we decided that our best option was to land with the gear up. After coordinating with American Flyers and KPMP ATC, we decided to land at KPMP RWY 15. Roughly on a 4 mile straight-in approach to RWY 15, we shut down and feathered the right engine and propeller, in order to limit the damage upon landing. During the landing flare, we shut down and feathered the left engine and propeller, and landed smoothly on the fuselage, stopping relatively quickly. We exited the aircraft and were met by fire rescue, who sprayed the underside of the plane with water.

OPERATOR/OWNER SAFETY RECOMMENDATION *(How could this accident/incident have been prevented?)*

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

have yet to find out what mechanism failed in the landing gear.
