Description of Damage to Aircraft and Other Property <i>(Use additional sheet, if necessary.)</i> Impact damage to landing gear fairings, horizontal stabilizer (right side), and leading edge of right wing.					
NARRATIVE HISTORY OF FLIGHT <i>(Please type or print in ink.)</i>					
Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.					
On 1/17/2025, at approximately 2230hrs CST, I was finishing a day of flying returning to my home base of Smyrna, TN (KMQY). While making a visual approach to runway 14, I struck the tops of trees on the approach end of the runway before making an otherwise uneventful landing. I was flying N21254, a 1972 Cessna 182P. I was the sole occupant on board at the time of the accident. The accident flight was the last leg of a part 91 cross country flight from Burlington, VT (KBTU) to Smyrna with stops at Penn Valley, Pennsylvania (KSEG), and Knoxville, TN (KTVS). I canceled my IFR flight plan with Nashville Approach approximately 20 miles out from the airport and got the weather at Smyrna. The initial report I received via the AWOS station reported the winds at 200 at 11kts, gusting to 22kts. The tower closes at 2200hrs, and I knew that runway 1/19 was closed for resurfacing, I made left traffic for runway 14. While descending through 4500 feet or so, I encountered moderate turbulence. While on a left base, I listened to AWOS again and it reported the wind at 200 at 11kts, gusting to 16kts. I turned final, corrected for the crosswind, and lined up for the approach. I had my speed at 80MPH and performed by final before landing (GUMPS) check. I had 10 or 20 degrees of flaps in and mentally told myself that I would not add any more flaps due to the gusty crosswind. I applied right aileron to drop my wing into the wing and counter with a little left rudder to stay lined up with the centerline of the runway. When I saw that I was below glideslope based on the PAPI, I added power to get back on the glide slope. As I added power the top of a tree(s) became visible in my landing light, and I heard a scratching sound. There was no change in direction or flight characteristics of the aircraft, and my initial thought was that I had scraped the wheels and wheel pants on the tree. I made an otherwise uneventful landing and taxied off the runway, ran my after-landing checklist, and taxied to our hangar. Upon exiting the plane, I inspected the main landing gear on the left side of the aircraft and observed damage to the metal gear leg cover. I inspected the right side and found damage to the right gear cover as well and saw where the leading edge of the horizontal stabilizer was damaged. I then pushed the plane into the hangar and turned the lights on. Once inside I found where the leading edge of the right wing struck the tree as well. Looking back on the incident, I now know that I applied aileron and opposite rudder too soon, which essentially caused the plane to slip and lose altitude at a faster than normal rate.					
OPERATOR/OWNER SAFETY RECOMMENDATION <i>(How could this accident/incident have been prevented?)</i>					
Maintain glideslope better on approach. in 20/20 hindsight, I transitioned from a "crabbing" crosswind correction to a wing down (slipping) correction too soon, causing me to get below the glideslope and I did not recognize it and add power before contacting the treetop.					

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
