Description of Damage to Aircraft and Other Property *(Use additional sheet, if necessary.)*

Because a gust got under the tail during a wheel landing the plane ended up upside down. The prop, both wings, Upper tail section, and upper fuselage, were all damaged.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink.)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Accident March 20, 2025, With Maule N4244L

I picked the plane up from Keller Brothers Airport, 08N departed at approximately 5:15 Pm. My plan was to fly to the home air strip about 15 minutes to the east. The runways at Keller Brothers are 07-25. There had been a cross wind that was moving more to the west. The home strip is a one-way runway landing to the west at 260 degrees and taking off to the east. I planed on flying over the home strip if the windsock showed favorable conditions I would land there. If there was any indication of a tailwind, I would go to Pottstown N47. I rent a hangar at N47 so if I don't like the weather at the home strip, I go to N47 and drive home. Flying over the home strip the windsock was limp; I had just replaced the sock and the rotating bearings, and it is just south of the strip and about 200 feet east of the threshold. The windsock gives a good indication of what is happening on the strip. With the sock limp I proceeded to travel east and turn back towards the landing strip. As I got lined up with the landing strip and still at around 1,000 feet MSL I took note of the cross wind and could easily keep the plane on center line with a fair amount of rutter, I also took a good look at the windsock on short final, I was prepared to abort but the sock was limp. Because I was headed directly into the sun, I looked out the side window to double check my glide path. I proceeded to land and elected to do a wheel landing because with the quartering tail wind I had at altitude I was expecting ground speed to be little higher than my air speed and I didn't want to float too much or stall two feet in the air and bounce. The landing was smooth and before I knew it, I was upside down. I was out of the plane in a matter of seconds. I looked around quickly and saw that the windsock was fully extended and blowing from the east. Later I went and looked at marks on the ground to try to figure out what happened. The tire marks start about 5 feet from the threshold and are consistent and straight, about 60 or 70 feet after the tire marks start there is a prop strike mark on the ground and about 20 feet from that the plane was upside down.

Looking back and evaluating what I did wrong. I put too much faith in the windsock and didn't put enough thought into what was happening with the weather. I did know there was a storm coming and the winds were going to change direction. They were going to change into more favorable conditions for me but there was a storm coming with that. I also knew the sun in my eyes didn't help but I don't believe that was the cause of the accident. I was thinking that I could have gotten the tail planted sooner. But after looking at the distance from touch down to the prop striking the ground. It could only have been a couple seconds from the time of touchdown till I was upside down. I have landed on this strip many times, it is a little on the short side very manageable, With the winds the way they were that day I should not have tried to land on a short strip with poor go-around options.

OPERATOR/OWNER SAFETY RECOMMENDATION *(How could this accident/incident have been prevented?)*

I should not have landed at this particular strip with the winds changing directions and they were gusting. I also should not have done a wheel landing. The though on the wheel landing was to assure th plane didn't float too much or stall two feet off the ground and bounce.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
