☐ In-Flight ☐ Fire at Unknown Time
☐ On-Ground ☐ Unknown

Description of Damage to Aircraft and Other Property *(Use additional sheet, if necessary.)*

Landing gear collapsed, both propellers bent, wrinkle on skin of left wing

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink.)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

At Greenville Downtown Airport (GMU), weather was VFR. Before turning on the engines, I told the student our plan: Runway 1 is in use; we'll do a NW departure, climb to 2500' until clear of the overlying Class C airspace, then up to 4,500' for slow flight, and steep turns, and then we'll work on landings at AND before coming home to GMU. This was not his first flight in this aircraft, but I still reminded him that the plane is only equipped with brakes on his side. After we completed the run-up, we called for taxi instructions. We were behind several aircraft at the hold short line. While we waited, I briefed relevant V speeds and the abort plan.

Once cleared for takeoff around 10:35am, he rolled out on the runway and lined up on centerline. I kept my fingers just below the mixture levers, to ensure that there was no way the student could pull the mixture levers out of distraction and/or unfamiliarity. He smoothly added full throttle and we started to roll. As the aircraft gained speed, I called out oil pressures green, oil temps green, airspeed alive, and a few seconds later, we were airborne.

Climbout was normal. I called "negative runway, positive rate, gear comes up" and Pilot Flying (PF) complied. I called his turnout and he continued to climb to 2500'. He started to level off at 2500', but his altitude kept creeping up. At 2800' I recommended that he lower the nose to level, reduce manifold pressures and RPMs to cruise settings and use the trim to help relieve the pressure on the yoke. He complied.

Once we were out from below the Class C, I had him climb up to 4500' and turn to a southwest heading. Once up there, I talked through slow flight flow with him just flying straight and level. As it was not his first flight in this aircraft, he received the instructions well and demonstrated. He held altitude well, held his heading well, turns were smooth. I had him come in and out of slow flight, re-establishing normal cruise a few times. He did all that well, so we moved on to steep turns. Like slow flight, he was performing better each time.

We decided to move on to landings. We turned towards Anderson, KAND; we were about 20 miles out. I told him to come down to 2500' as I plugged in the weather and CTAF frequencies. Winds were variable at 6, so we decided to overfly the field to first to see which way the sock was favoring, as there was no one making any calls at the airport. Based on winds aloft, I thought 23 might be our best choice, and overflying the field confirmed this, so we set up for the left downwind 23.

A few miles prior to arriving at the airport, I talked him through the pre-landing checklist, making sure everything was completed, as well as briefing VLE and VFE. Once in the traffic pattern, I coached him through configuring the aircraft to land, from lever settings to speeds.

As we turned final, I noted stabilized descent and steady airspeed. Once we were low and in ground effect, I said, "Power idle" and he pulled the throttles back. The landing was firm, but not unsafe as the plane touched down on the mains first on centerline. As soon as the nose-wheel made contact with the runway, the nose began swinging wildly left and right and I could feel PF trying to correct it, but by the

OPERATOR/OWNER SAFETY RECOMMENDATION *(How could this accident/incident have been prevented?)*

but by the time I recognized PF may have been over-correcting, we were off the runway. The aircraft exited the runway to the right into the grass, across Taxiway A, before coming to a stop on the other side of A, in the grass. The landing gear collapsed there, causing the propellers to hit the ground and come to a stop as well. Both of us were uninjured and exited the plane via the normal door on the right side of the aircraft.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
