Description of Damage to Aircraft and Other Property (Use additional sheet, if necessary.)

It should be noted that this accident is still under investigation and additional damage and information may be discovered as the investigation progresses. One tail rotor blade exhibited evidence of catastrophic failure consistent with what you would expect to see if it struck an object while the tail rotor was under power. The tail rotor blades were still attached to the tail rotor gearbox which departed the aircraft and was found approximately 500 feet South of the accident scene. The lefthand vertical stabilizer was slightly bent inwards, and the righthand vertical stabilizer showed signs of having been struck by an object (likely one of the main rotor blades). The fuselage slid laterally approximately 12-18 inches off its skids, but showed no evidence of damage to the belly of the aircraft. The copilot (lefthand) door window was cracked when it was struck by the medical crewmembers shoulder during the accident sequence. The lefthand clamshell door

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Aircraft N117NC was involved in an accident while on a VFR flight plan for an interfacility patient transfer from Princeton Medical Center, Plainsboro, NJ, to Penn Presbyterian Medical Center, Philadelphia, PA. The patient transport was conducted without issue. The pilot departed PA39, Penn Presbyterian Medical Center helipad, and was en route to KLOM, Wings Airfield, the aircraft's home base. The pilot was flying at approximately 1300 ft. msl at around 120 kts indicated airspeed. At about 3-4 miles south of KLOM while getting ready to enter the left downwind for runway 24, without any visual or audio warnings, the aircraft became uncontrollable and was shuddering violently. The pilot had no tail rotor control with the pedals and had lost tail rotor thrust, so he lowered the collective and entered an auto-rotational profile. The pilot identified a grass area and aimed for it. The pilot landed on a driveway and grass after spinning roughly 180 degrees. Upon initiating the spin, the pilot immediately lowered the collective, conducted an emergency shutdown, and engaged the rotor brake.

OPERATOR/OWNER SAFETY RECOMMENDATION (How could this accident/incident have been prevented?)

We immediately evaluated our only other legacy BK117 to determine if it had the same air conditioner installed. Upon finding that it did not have the same air conditioner, we determined no further actions needed to be taken until the investigation progresses.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

It is suspected, but not confirmed, that the air conditioner louvre panel failed and departed the aircraft precipitating the failure of the tail rotor gearbox and assembly.
