Description of Damage to Aircraft and Other Property *(Use additional sheet, if necessary.)*

Left main gear folded back into bottom fuselage. Left bottom of cabin fuselage dented by folded left gear impact. Left wing bent. Propellor blades bent. Bottom of engine cowling dented. Fuel line from firewall to engine broken.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink.)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The accident occurred at the conclusion of a planned half hour instructional flight in a 1948 Cessna 170. The student occupying the left seat was not in control. I was occupying the right seat and manipulating the controls at the time of the accident. The wind was blowing from approximately 240 degrees magnetic at a steady ten to twelve knots with occasional gusts to about seventeen to eighteen knots as best I can estimate. I was landing the airplane at the point of departure (Oxford County Regional Airport 81B) on Runway 15. This gave me a direct crosswind from the right. I elected to make a wheel landing due to the conditions. The aircraft touched down uneventfully on the asphalt runway. The aircraft deaccelerated normally on its own. No brakes were applied. However, a sudden gust of unexpectedly high intensity caused the plane to drift to the left of the centerline. The nose of the airplane then began to rotate to the right. Full application of left rudder failed to stop the rotation of the nose to the right, so I added full power in an attempt to increase the effectiveness of the rudder. The rudder became more effective and the rotation to the right ceased. The rudder was not effective enough to keep the plane on the runway. I would estimate that the nose never rotated more than 45 degrees to the right. Once on the narrow grass strip (20' wide + or -) between the runway and a drainage ditch running parallel to the runway, the aircraft tracked straight ahead at an angle between 25 degrees and forty five degrees to the right of the centerline. I had enough control with full power and full left rudder to keep the plane tracking straight, but not enough control to overcome the cross wind and rotate the nose of the airplane to the left. The right main gear went over the edge of the ditch which drew the aircraft down into the ditch. The aircraft travelled along the ditch for a hundred feet or so. The left main gear struck the opening of a concrete culvert which runs underneath Bravo taxiway. This taxiway allows access to the runway from the Northwest end of the main ramp. It is not the abandoned taxiway closer to the approach end of Runway 15. The impact bent the main gear back into the fuselage below the cabin. The aircraft then rotated about 100 degrees to the left as the right main gear did not collapse. The left wingtip impacted the taxiway as the fuselage slid across the taxiway and came to a rest in the grass just on the southeast side of the taxiway pavement. The left wing spar was bent. The propellor blades were curled back. The lower engine cowl was battered. we were able to exit the aircraft without much trouble through the right seat door.

OPERATOR/OWNER SAFETY RECOMMENDATION *(How could this accident/incident have been prevented?)*

If there had been clear areas next to the runway, this would have been a non-event. The worst that would have happened would be a knocked out runway light. This was not a classic ground loop. I never felt completely out of control and had the plane tracking straight just before the airplane slipped down into the drainage ditch. A 75ft to a 100ft wide clear area running beside the runway would have prevented the accident. An AWOS might have helped. I was told that because an AWOS was present at KLEW (a field about ten miles away), funding was denied for an AWOS at 81B. I don't know if that was true, but if I had heard accurate weather reporting at the field where I was landing (81B), I might have judged the crosswind and the wind gusts as too much for the airplane and landed at another nearby field with wind more aligned with the runway.
