NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

To follow is my recollection of the flight.

At 6 PM I called 800wxbrief to get flight information. Everything seemed nominal. Clouds would not be a factor because there were no clouds near my maximum planned altitude of 3500. Only an airmet for moderate turbulence covering all of Long Island was the only abnormality but I did not think it would be an issue for my passengers since the two girls in the plane are also pilots and my fourth passenger is a fitness instructor who does not get startled easily, I also confirmed with him that he does not have motion sickness. WXbrief said winds in the Montauk area are light and variable so I was preparing myself to land on runway 6 at KMTP since I just landed on that runway a couple weeks ago and had it fresh in my mind. Fuel was full in both tanks, we were below max gross weight by a couple pounds upon takeoff at KFRG and within limits of landing and takeoff distances at KMTP. The flight began as a usual VFR flight and I received flight following from New York approach 120.05 after departing KFRG. There was no turbulence on the flight despite the airmet for moderate turbulence all over Long Island. This made me believe that the winds were probably going to be light and variable at Montauk as predicted. When I was passing East Hampton I checked their METAR since it is the closest airport with ASOS/ATIS reporting... I believe it was 240 at 5 and checked when I was about 10-12 minutes from KMTP. I figured that landing on runway 6 at KMTP was still fine since East Hampton did not have strong winds and it was not Montauk... and Montauk weather was predicted light and variable as per WXbrief.

I over flew KMTP to make sure there were no wildlife on the runway and to check wind sock direction however it was so dimly lit all I saw was runway lights and a plane lined up to take off on runway 6, which made me believe that pilot checked the windsock... The first landing attempt resulted in a go around because I was not lined up with the runway; I was focusing on looking for the wind sock and wildlife I became uncoordinated. When going around my passenger in the rear mentioned she was feeling anxious and thought we were too low. I believe she was spooked by me saying we were doing a go around in the nighttime dusk... Upon landing, my speed was a little too fast resulting in a short bounce and maybe another small bounce. The nighttime darkness also played a factor because KMTP is very dark, therefore not the easiest to judge how much space you have between your wheels and the ground. I applied brakes and the plane would not stop. We went into the shrubs at the end of the runway, the plane turned and settled. Afterwards someone pointed out that I left skid marks down the runway. I believe I locked the brakes on the second bounce and when it landed I went into a solid skid until the end, resulting in minimal deceleration. The Piper Warrior I was talking to as I was nearing the pattern was taking off on runway 6 and gave me false assurance that runway 6 definitely favored the winds. Nassau Flyers whom I rented the plane from pulled the data and said I had a solid six knot tail wind on final landing. This is probably the cause of the accident.... followed by the bounce and the skid down the runway.

OPERATOR/OWNER SAFETY RECOMMENDATION (How could this accident/incident have been prevented?)

Do not trust that another pilot is not flying with a tail wind. Visually look at the windsock yourself at an uncontrolled airport instead of assuming another pilot already did. Closely monitor the approach and go around if unstable in any way. Closely watch ground/indicated air speed at all times in the pattern. Fly with the lightest load possible (least amount of fuel) needed to complete the mission when operating on short runways.
