Description of Damage to Aircraft and Other Property (Use additional sheet, if necessary.)

The leading edge of both wings were damaged by impacts with limbs. In the right wing, areas were crushed all the way to the spars. The flaperons were heavily damaged, The Main and tail landing gear doors were ripped off. The Horizontal stabilizer had been driven into the elevator automatic control connectors such that they were delaminated. The vertical fin had damage to the right side where it was punched and also some cracks were seen internally behind the structure of horizontal stab mounting pins. The canopy had scrapes and cracks caused by impacts with limbs. Several days later the glider was removed from the trees by a recovery company. I tried to assist with disassembly and found that the main spar pin was bent and could not be removed resulting in their sawing the wings off the fuselage.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On August 13, 2025, Myself and a group of other soaring pilots attended a preflight meeting at 10:00 am: The topics included safety, staging and towing operations. It also included weather: expected winds, clouds and thermal strength and expected soaring end of day.

After staging at 11:00 am. Launch operation began shortly after 12:00. I was launched after several other gliders with my tow beginning at 12:32. After towing to 3,800 ft MSL (2,500 AGL). On the Sinking Creek Ridge I entered thermal lift and climbed to near cloud base 4,700 ft MSL. Then moved from lift area to lift area while crossing several valleys into West Virginia. During which I was flying between 3,800 MSL and 5,700 MSL. I then turned around and returned to the original Sinking Valley Ridge leading back to New Castle. I heard a few glider pilots call downwind for landing as I approached the area.

I wanted to land early so as not to be crowded in the landing pattern with the many other gliders to come later. This was to be my first landing there in 6 years. I also needed to test run my Jet Sustainer. I entered the area from the south over the airport at 3,200 ft. MSL. Starting the jet and completed a 90 second jet run and climbing to 3,500 ft. MSL (2220 AGL)

After shutting the jet down, (First Mistake - I did not switch the controller to retract the jet). I then turned left to head south and enter the pattern for a right down wind to land North. Upon entering down wind, I made the radio call announcing my landing intentions. Then said out loud to myself the acronym "FUSTALL" and began preparing the glider for landing. Flaps (Set to 4), Undercarriage (Lower Landing Gear), Speed (70 Kts), Trim (Set to maintain speed), Airbrake (Check Operation of Spoilers), L - L (Look/Land).

After configuring for landing I immediately noticed that my decent rate was extreme 3.5 to 4.5 kts. instead of the normal expected 1.5 to 2.5 kts. (I failed to recognize that I had failed to retract the jet). Confused I attempted to resolve the problem by adjusting the flaps and closing the spoilers. In doing so I lost control of the flaps, and they were now full negative instead of + 4. This further increased the sink rate. In the downwind leg the terrain rises and is higher than the runway. The higher sink rate compounded by the higher terrain ended in me being too low to complete the turn to final. During the last 30 or so degrees in the turn to final it became evident that my right wing would strike a row of trees on top of the hill 300 +/- feet from the threshold of RW 36. I rolled out of the turn to prevent catching the wing tip and probability of spinning in. Now head on to the tree line straight ahead, I applied full spoilers and full aft stick and hit the treetops with reduced speed in a mush. Upon landing I made a radio call report to ground control: I am uninjured and will need assistance getting out of the tree. The flight recorder indicated that the flight ended 13:52.

OPERATOR/OWNER SAFETY RECOMMENDATION (How could this accident/incident have been prevented?)

The Acronym: FUSTALL did not include to verify the condition of sustainer motor. After going through the flow of FUSTALL three times I still failed to recognize that the jet had not been retracted. I will need to modify my flow to include Motor retracted.

My lack of time flying flapped gliders caused me to fail to control the flaps properly.

I will need to sit in the glider and visualize and practice the location of the flap handle and muscle memory needed to control them.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Total Time/ Cycles On Part

_____ Hours

_____ Cycles

Time Since This Part Inspected/Overhauled

_____ Hours

FUEL & SERVICES INFORMATION**Fuel on Board at Last Takeoff**
