Description of Damage to Aircraft and Other Property (Use additional sheet, if necessary.)

Both wings totaled and parts of frame strewn in forest. Canopy removed.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Departed CTY approximately 415-430 est for EKY. I knew very well that there was a smaller thunderstorms 30+ miles west of my route heading east, and a storm to my east heading east which would not be a factor. There was intermittent overcast with patches of rain on route and ceilings approx 5k. I had the option to land, fly under the ceiling or fly over. I chose to fly over and look for spots to fly under upon upon passing spots of possible precipitation.

My route took me higher than i was comfortable but i topped out at 11k and began descending to 10k and looking for spots to continue descent as light waned. At this point, perhaps 6pm est I showed elevated cylinder head temp. I did not consider carb ice because the carb is above the engine, and my mechanic suggested carb ice was rare, but I had pulled cabin heat given I was cold at altitude, and this contributed to icing without my understanding.

I contacted Montgomery to create a plan, they passed me to Cairns, who stayed in touch as I had to go through clouds to find an airport. We decided against Eufaula due to low ceilings and chose 25J which was 5 miles east of me with 5k ceiling.

I came under clouds at 5k approx AGL and noted no icing on wings, though I was focused on stall prevention and engine temp vs doing my landing checklist which would have gotten me out ok (correct frequency for lights, fuel pump may have helped, obviously landing light and nav lights helping with instruments etc).

ATC vectored me due east, it was quite dark with no city lights nearby. I was running 3-4k RPM trying to keep engine load low while the cyl temp gradually improved due to warmer air, which I was glad to see but again did not understand. There was briefly the smell of engine smoke. I could not get runway lights on because in my workload I did not consider I was on with ATC still (I probably needed to better vent the cabin to improve mental clarity also). I had a good view of the runway approximate location when I lost ATC around 1700 feet perhaps due to clouds.

Triangulating with engine heat, altitude and RPM I began looking for the beacon, which I saw, and decided to go around to approach from runway 18, still not understanding why there were no lights. ATC could have solved this easily for me although he heard me clicking and together we probably should have figured out the proper frequency (it was also 6 clicks). While I was coming back around I got too low and clipped tall trees in the direction of the airport. After hitting trees my plane fell to the bottom of the canopy. Relieved to be ok, i flicked on the ELT, got out, decided to leave my things and began walking to the airport. I called the airport unsuccessfully and then the sheriff so ATC could know my condition. I had a mild concussion and whiplash.

My speed into the trees was likely 50-55kts.

OPERATOR/OWNER SAFETY RECOMMENDATION (How could this accident/incident have been prevented?)

I did not discuss in detail with FAA but in retrospect even with 60 hours in type I needed greater cross country scenario training in my type of aircraft before considering trafficking above or around weather. In my checkride prep I got extensive maneuver practice but situational awareness is crucial, including in this case that carb icing leads to engine temp issues, not just loss of RPM.

In past, I have grounded aircraft when near storms. Other times i have had no issues. Being above clouds near nightfall is a challenge and I was concerned about this at the time as well though believed I would get a window to descend and light from full moon. In retrospect there was no great pressure to get home so my prior choices of staying low would have been best, because of optionality. I also underestimated the challenges of doing much of anything else when there is the possibility of an engine overheating.

Also, among many other issues leading to the incident, ATC gave me certain airport details but I should have asked them for additional help as I was able.

Finally, proper landing checklist management and correct frequency / knowing 6 clicks would have helped me land safely.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
