NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I (the PIC) was making the first flight, one day after the annual inspection. A complete pre-flight per the Cessna 195 manual was conducted to ensure correct performance and safety of the aircraft/pilot. No problems found. VFR conditions with winds light and variable, gusting to 8 knots. Run-up per Cessna manual was normal and acceptable. Take off runway 26 at approximately 1345 hours, having to hold light left rudder to maintain the center of the runway. Takeoff was normal in all other parameters with light winds gusting to 8 knots. Stayed in the pattern, making a low, simulated approach to confirm aircraft performance and stability. Proceeded to the cross wind leg in the pattern without any indications of problems. Continued in the pattern and on final, set up the approach with full flap extension. Normal Landing configuration with current wind information.

Main wheels touched down first, made a slight hop on initial runway contact and traveled approximately 50 to 70 feet and touched down with the main wheels again. The tail swung to the left, the nose to the right. It felt like the right brake was tight or hanging up. On second touch down seconds later, the tail swung moderately to the left. Applied opposite (left) rudder and light brake. Aircraft responded as expected, regaining control. The tail wheel touched down and the plane's tail swung hard to the left. Was traveling at approximately 40 to 45 MPH. Left rudder applied with moderate brake to regain stability of the plane. The plane continued to skid to the left with little to no correction from the application of the brake and rudder.

The plane came to a stop off the runway on the grass median. Immediately thereafter, the fuel selector place in the off position. Master placed in the off position. Magneto/ ignition key switch to the off position and I exited the aircraft.

No wing contract and/ or damage. No hull contact with the ground. Aircraft stayed on its wheels.

Probable contributing factor is a nail (FOD) in the right main tire. Right main tire appeared to be under inflated when the aircraft came to a stop; a result of the FOD. The tires and associated pressures were checked and verified according to the Cessna 195 manual one day prior to the flight; before the wheel pants were installed. When the tire is fully inflated, there is approximately 3 inches of ground clearance of the wheel pants and limited wheel/ tire visibility. Within one hour of the ground loop, the right main tire was flat. A picture of the FOD is available.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

check for FOD in the tire tread prior to takeoff.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
