Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The right wing leading edge was crushed flat from a deer impact. It was about 4 feet in length and disrupted the airflow over and in front of the right aileron.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The departure airport was KONZ. The time was 4:45 PM EST. The weather was VFR.. During the takeoff ,at VR 130kts a faint bump was felt and both pilots acknowledged the abnormality. It was during rotation and V2 133 was called out. All seemed normal for these few seconds. With great force the flight controls began to shake wanting to make full oscillations in aileron and in pitch as the jet began a slow yawing roll to the right. Full left ruder and full left aileron could not stop this horrific trend. I stated to the co-captain , " I'm not doing this ! There is something wrong with the controls." It seemed that an impacted was going to be eminent and we would all be dead in fire and I didn't know why. No annunciators,no stall, no engine failure ,just seconds to die and not know why. What input , what pilot action,could I do to prevent certain death.? Then the wing slowly began to come back up. The control forces shook with greater intensity. I thought that what ever happened at VR was going to fail and depart the jet. We had cleared the end of the runway and where heading over lake Erie! An emergency was declared with Detroit ! We still didn't have control of the jet and it wanted to roll right very very very badly. It was about ten seconds into the flight and we could not turn the jet to the right as it would have certainly rolled into the lake. The co-captain stated,"lets stay over the lake, we don't what to take out any houses" That's how bad it was! The jet was still flying and we made small power adjustments. Discovering that at 160kts the jet wanted to roll right and that above this speed the crew could hold the wings level. We briefed for a high speed landing attempt at KTOL. We briefed the passengers to use the aft facing seats and how to use all exits. I had asked John Bates the owner/passenger earlier to look at the wing as the flight crew struggled over the lake. He said , "oh my God there is a huge bobble in the right wing." There is no huge bobble or oh my God check list to use in the LJ-35. The runway at Toledo is very long and would require less of a right turn than that of Detroit Metro. I still didn't know if we would make the runway and if we did what was going to happen with directional control at touchdown. No configuration was attempted. Gear down, flaps at the same take off setting and a REF of 180kts kept the jet flying. The abnormal landing was briefed again. The fire crews where advised that loss of control could be to the right. We made a normal high speed landing with out loss of control. A light continuous braking action was used. The tires remained inflated and we came to a stop on the runway. I turned the steering on and taxied a very short distance to the ramp. We lived. Don't try this at home. When we exited the jet everyone looked at the right wing. The leading edge was crushed flat out board of the stall rail for the length of the aileron. I turned on my phone and a TX said that I had hit a deer. I never saw a deer on or near the runway. I had landed on that same runway at KONZ less than ten minutes prior to the departure. Also at that time there were no deer. Also I was very surprised that the faint thump at VR was a deer. I had hit birds that made more noise and felt more impact than the deer did that day. The worst part was not knowing what I was dealing with. How do you fix the unknown? Even if the passenger shades had been opened I don't think that I would have been able to look behind at the copilot wing. I could hardly scan the annunciator panel due to the force and vibration of controls occupying all of my attention. I had even commanded the SIC to look at all of the annunciators,T R S, hydraulic and engines. The systems were normal. But the 7 minute flight was very abnormal.
