Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I started flying that day a little bit later than usual to wait for the 50 hour inspection. There was one 1.5 hour flight with me and another student before this flight started. After the student (4 hours total flight time) did his pre-flight, I did my pre-flight as well. During the pre-flight from the student, fuel was topped off the main tank as usual.

After the start-up we calculated the 5 min take-off power and the MCP and we departed from Chino (KCNO) to Corona Airport (KAJO). The lesson that day was take-offs and landings for the first time including positions reports on each traffic pattern leg.

There was no traffic at the non controlled airport Corona. After checking the AWOS, we started to fly traffic pattern to runway 25. At this time the wind was almost calm and a short time later the second helicopter from our school arrived. Both helicopters flew the traffic pattern to the runway 25. We did that about 5 times before we heard on the radio about incoming fixed-wing traffic for runway 25. I decided to switch to the south side of the airport, where helicopters supposed to land. The south-side is also called south grass. It is an area with a uneven surface like a farmer's field. More than half of it is a "no hovering" area starting after 1/3 of the beginning. The approaches up to this point went smoothly and I felt on the controls, that the student was able to give the correct inputs on the way to the ground. I always was with him on the controls and gave him time to fly by himself before I supported and corrected him. We flew a left close traffic and on final everything looked good. At this point I had to correct his turn a little bit from base to final and the correct amount of collective input to establish a nice descent rate with a level attitude. Everything looked very good and there was a point where you just have to wait for the helicopter to settle on the path down to the landing spot we were aiming for. At this point, the wind was about 11 knots exactly from the front and temperature was 33 degrees Celsius. We drifted slightly to the right, so I corrected that after the student was not replying enough for my verbal instructions. The entire maneuver I was talking through it, so I described what he should do or/and what I am doing right now – how I always do. When we came closer and closer to the ground everything still looked very good, we might have been slightly steeper than on a perfect approach – but we were at an optimum airspeed. At the expected point, where we lost ETL, I told the student to recognize the vibrations and to slowly start raising the collective in combination with left pedal and forward cyclic. The entire time I was with him on the controls and was able to correct and support his inputs. I recognized, that the student didn't raised the collective enough and also didn't give enough left pedal. We also drifted slightly to the right at the end. I gave the student time to correct it on his own by just talking to him what he should do. When the helicopter yawed to the right very close to the ground and due to the lost of ETL descended faster instead of slowing down, I gave the correct amount of left pedal and forward cyclic to get the helicopter straight and level before we hit the ground. At this time we didn't have any in ground effect at all as usual. Even a massive input with the collective wasn't able to stop the descent at this point anymore. We hit the ground with a level attitude, but then the front portion of the left skid get caught on the ground and stuck. Around this pivot point, the helicopter started yawing to the left, due to the existing forward momentum. At the same time, it started to roll to the left. When we yawed about 60 to 70 degrees to the left the helicopter rolled so far to the left and the the main rotor hit the ground on my left side. This pushed the helicopter back up and prevented it from falling on his left side. When the main rotor hit the ground my seat collapsed. As soon as we were on both skids again and the helicopter stopped moving, I pulled the mixture and switched off the master.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Do not use this area to practice approaches with students, who are doing this for the first time.

Make the first approach to that area completely by yourself when you are switching from the runway surface to a rough field surface.
