Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Hole in fence north of runway 26
Right spar near wingtip bent
Right wing skins near wingtip wrinkled
Right gear box collapsed
Propellor tips bent
Right horizontal tip shredded by fence

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On 7/16/2015 at 4:05 am, a runway excursion occurred on takeoff roll on runway 26 at Rosamond Skypark CA, identifier L00. The aircraft was 1952 Cessna 170B, serial number 20880, tail number N8028A. There were 3 people onboard. The pilot was Grace Wang. The pilot's rating is private pilot ASEL, certificate number [REDACTED]. The rating was issued on 3/23/2014. The pilot holds a current third-class medical.

Description of the occurrence is as follows. As the aircraft started gaining speed on takeoff roll, the tail lifted, and the aircraft yawed to the left. The left gear ran off the runway on the left side by about 1 ft. The aircraft then yawed to the right, the tail came down and bounced on the runway several times. The aircraft veered off the right side of the runway and continued through the chain link fence on the north side of the runway. The aircraft came to a stop on the berm adjacent and parallel to the fence. The right gear had collapsed, the right wingtip had hit the ground so the right wing spar was bent, the propeller had hit the berm, and the tip of the right horizontal tail was shredded by contact with the fence. The chain link was broken and two fence posts were bent. There were no injuries to anyone in the aircraft or on the ground.

Interpretation by the pilot of the occurrence is as follows. As the aircraft accelerated on takeoff ground roll, the pilot put too much forward pressure on the yoke and picked up the tail too quickly and too early in the ground roll. Gyroscopic effect from the rapid lifting of the tail, and p-factor, yawed the aircraft to the left. The pilot put in right rudder pressure, but a combination of not-quick-enough pilot reaction time and insufficient rudder authority at low speeds allowed the aircraft to continue the yaw long enough to take it off the left side of the runway. When the aircraft responded to the rudder inputs and started yawing to the right, the pilot pulled back on the yoke to bring the tail down. The tail contacted the ground and bounced a few times. The aircraft went into the dirt on the right side of the runway, and the pilot pulled the power and applied some amount of left rudder. The rudder applied was enough to arrest yaw rate of the aircraft, so it was travelling on a straight vector about 45 degrees from the runway, but not enough to overcome the rotational inertia of the aircraft and start a yaw rate back to the left. The aircraft continued through the fence on the north side of the runway and came to a stop on the berm.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

1. Wait until later in the takeoff ground roll to pick up the tail, and put less pressure on the yoke so the tail picks itself up more gradually
2. Since PIC is low-time taildragger and especially low-time taildragger/night pilot, put instructor in right seat
