Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The left landing gear was dislodged from the gear box, propeller blades bent, cowling damaged, one wing strut damaged, one wing tip damaged, vertical stabilizer and top of rudder damaged.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The flight departed OR65 at 2:17 p.m. with myself and two passengers on board. Before departing we obtained a full weather briefing from flight service. There was nothing I noted of significant weather that was a concern for this flight. We then flew to Mulino to fuel the airplane. After fueling the flight departed Mulino at 2:41. We climbed to 7500' on GPS direct course to the Jepsen Farm Airstrip near Lone, OR. We arrived over the airstrip about 4:05 p.m. I then flew a low pass over the airstrip, looked at the windsock and observed there was a slight tailwind but also knew that I would be landing uphill which I believed would more than compensate for the slight tailwind. I then flew a regular left hand pattern and established a normal approach about 70 mph and added two notches of flaps landing to the South. I landed the plane using a 3-point landing and began rolling out and everything seemed normal. I noted that I was slightly left of the center of the airstrip and added right rudder to move the plane a bit closer to the center of the airstrip. The plane responded and began to gently swerve to the right as I expected. I then added left rudder with a little left brake to reestablish directional control down the center of the strip. The plane did not respond to my input as I expected. I then applied full left rudder and more brake but the plane seemed to simply be skidding and continuing on the swerving right course and not responding to my inputs. In spite of my best efforts to straighten the aircraft I was unable to reestablish directional control. The plane continued a gradual swerve to the right departing off the airstrip, continuing over a small burm, crossing a small gravel road, hitting the burm on the other side of the road, then bouncing about 30' forward and finally coming to a slow rest. As the plane was coming to a rest the physical momentum caused it to come up on it's nose and it slowly rolled over on its back and the plane came to a final rest upside down. I then verbally directed everyone to get out of the plane as fast as possible due to the possibility of fire. We were all able to get out relatively quickly. I then turned the master switch off and ensured the fuel selector was in the off position and put the flaps back in the neutral position. We then called for help on the cell phone.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I can think of two things that may have prevented this event. In retrospect I believe I would choose to land into the wind downhill rather than uphill with a tailwind. My impression after landing was that the wind was stronger and gustier than the windssock led me to believe. The other thing I could have done is not tried to move closer to the center of the strip and just hold the plane straight and roll out without trying to adjust closer to the center of the strip.
