Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Substantial damage to nearly all surfaces and wing tips. Motor mounts all sheared off on direct impact, pushing firewall toward panel. Landing gear broken at final impact. Propeller clearly under full power at impact, tips bent in "U" shape, spinner indicates straight in impact, with rotational swirls consistent with turning in the dirt at impact. Cockpit integrity and seat belt and shoulder harness was life saving.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Departed Burley, ID (KBYI) approximately 13:05pm (MDT), having fueled to tops of tanks (48 gal. usable). Requested Flight Following from Twin Falls Departure, received flight following after leaving 8,500ft from SLC. Course direct to Susanville Municipal (KSVE) approx 238 deg. mag. Convective turbulence and variable head winds much of the trip. Altitude 10,500msl. Beginning approximately 50nm NE, continued to check SVE AWOS periodically for conditions. Winds were reported regularly from 180 or 190 degrees (mag) at 19 to 22, gusting to 25 to 28. Best choice of runways at SVE from experience was dirt Rwy 25. Each check of AWOS inbound solidified that choice. At approximately 10nm from airport, approach speed slowed to 90kts.

Normal speed on final for calm wind approaches for N1417X was 70kts. PIC planned final at 75kts to help compensate for gust factor. 75kt speed was maintained, at approximately twenty feet above threshold for RWY 25, airspeed suddenly dropped to 60kts, I immediately added full power in an attempt to go around. Aircraft began to accelerate and lift, when very suddenly, the left wing abruptly lifted (to what seemed like vertical) causing the aircraft to turn sharply right. As it did so, all remaining altitude was quickly lost. (The following is somewhat speculation), but I believe as it lost altitude, the right wing tip touched down, then in almost a cartwheel, the nose hit the ground, followed by the left wing which suffered the most apparent damage. The aircraft then finished on it's belly. Immediately, I shut down all electric, ignition, and set fuel selector to off. Once I established that my passenger and I were OK, I phoned the airport manager and told him I had just crashed while on approach at RWY 25.

Passenger and pilot exit out the door and over the wing was normal.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The aircraft has been well maintained, pre-flight checks always completely performed. All in-flight procedures and landing procedures including airspeeds were maintained upon final approach. Constant scans of both indicated airspeed and the runway windsock supported continuing the landing as established. The sudden change in apparent surface wind conditions could not be anticipated. The PIC had performed the same procedures under similar wind conditions (both velocity and direction) many times with success. Both PIC and passenger were wearing lap belts and shoulder harness securely fastened. Doing so, saved lives!
