Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Lower vertical stabilizer bent. Port horizontal stabilizer bent. One of three "Starflex" rotor head component arms broken. Scuffing to one main rotor blade. Sheet metal damage to tailboom at or near attachment points. Substantial airframe "keel" cracking due to heavy vibration. Probable sudden stoppage damage to internal engine and drive train components.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The flight departed Salt Lake International airport at approximately 08:30 Mountain time on September 9, 2015. The aircraft was being used to recover a fallen hiker in remote and nearly vertical terrain of the Lone Peak Wilderness area. After briefing all recovery team members on the operation, a skid load technique was employed to position the helicopter to load the victim into the rear cabin from the starboard side. Unknown to the pilot, one of the recovery team had secured himself to a rope that was anchored above the tip path plane of the helicopter. As the team member approached the helicopter to begin loading, a main rotor blade came into contact with the team member's rope, approximately 10 inches from the blade tip. The result of the contact was an immediate failure of one component in the main rotor system. The aircraft rotated abruptly to the left and began to shake violently. The pilot regained control as the tail skid and horizontal stabilizer came into contact with the ground. A power reduction was made and the aircraft assumed a low power and airspeed descent to a suitable landing area. No warning and caution lights were observed, vibration was light, and tail rotor authority was confirmed. An appropriate level, grassy area was located and upon applying power to land, the aircraft began to shake violently again until touching down and reducing collective pitch. The aircraft remained upright.
