Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

One main rotor blade dented. Top of tail boom aluminum skin damaged at point struck.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

At approximately 0915 N44XL departed KLNA for a flight in the local area to conduct flight training. KLNA AWOS was obtained via radio on 119.925. During the end portion of the flight, after having returned to the airport at approximately 1000, practice autorotations were being performed. The student performed 3 practice power-recovery autorotations to runway 03. After the last autorotation, the instructor took the controls to demonstrate a full-down autorotation. The instructor maneuvered the aircraft into a tight right down wind leg for runway 09 to perform a 180 degree autorotation in order to avoid traffic still using runway 03 and take advantage of the winds that had shifted from the north to the east. Autorotation entry was smooth, the glide and turn were performed with airspeed ranging from 65-70kts and rotor rpm between 98%-102%. At approximately 300 feet, all turns were completed with airspeed at 70kts, rotor rpm between 100%-102%. At this point the throttle was rolled into the detent. At approximately 40-45ft the flare portion was performed, building rotor rpm to 106%. After observing the decent rate and aircraft speed slowed, the instructor leveled the ship with forward cyclic and raised the collective, observing the light/horn indicating 97% rotor rpm just after doing so. The aircraft attitude was not sufficiently level, causing the rear of the skids to touch first, this was observed and corrected for with slight forward cyclic. The touch down was not observed to be excessively hard or uneven. After the maneuver was completed, the aircraft was returned via hover taxi to the helipads with no abnormal vibrations observed. Damage to the aircraft was discovered only after aircraft shutdown and post-flight inspection.
