Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The left horizontal stabilizer and elevator seem to be ok. The wheels may be ok but have not looked at the rims to see. The avionics powered up but did not boot all the way up. Right wing is totally damaged, the left is damaged and the spar is not straight, it has ripples in the aluminum leading edge skin. Fuselage is extremely damaged, right door is extremely damaged. Left door has minimal damage. Seats are ripped and bent. Engine would have to be taken apart to know for sure but I have been told the crank has probably spun because you can not turn the motor when trying to turn the prop. Tailwheel bent. Spinner and coving destroyed.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On October 21st I took off in a Rans S7-s aircraft with a turbo charged Rotax engine from UT99 and was going to a fly-in close to Reno Nevada. My route took me over Gerlach Nevada and I saw a windsock and a landing strip. I was 1000 AGL when I passed over the town. I wanted to take a look at the landing strip thinking in the next 2 days I may fly back to Gerlach and land. From 1000 AGL I could not see much detail but what I did see it did not look like a place I wanted to land. I did also see the windsock and the wind was blowing straight down the airstrip. After descending more and flying downwind I started a left turn so that I could fly upwind parallel to the airstrip and take a better look. I was not attempting to land as reported by the media already. I went to full flaps then maybe 5 seconds after that I started the left turn. I completed the left turn and saw the landing strip and windsock I was offset maybe 1/8 of a mile and a mile to a mile and a half west of the airstrip while flying parallel to the runway. At this point the flight controls in pitch became loose as if the tail stalled but it roll the flight controls felt normal, and the plane did not feel or indicate a stall, and right after that the aircraft pitched nose down. As soon as the nose pitched down I added power, At this point my sensation was that the plane was flying but being pushed to the ground with no feedback from the elevator. As the ground approached my thought moved to just try and add back pressure at the last second to try and have the bush wheels impact the ground first to take the impact energy which is what happened.

Some interesting facts about the aircraft:

With 285 hours in the plane since January 2015 I feel I know the plane pretty well. With VG's on the wing the aircraft does not stall like a normal airplane. During my 40 hours of testing I did countless stalls, over 100. The plane would never drop the nose or wing during a stall. I remember being 4000 feet AGL and keeping the nose on the horizon with idle power and the aircraft would hold that attitude but the VSI would show between 700-900 FPM decent. Goto full power and hold attitude and the VSI would come up to 0.

As far as what do I think happened, I wish I knew for sure, but my best guess as of today is that wind shear, a wind change or gust, or possibly even a dust devil took out the tail which would pitch the plane nose down (due to the tail being unloaded) and then pushed the plane to the ground. When I got out of the aircraft the first guy I saw said "it looked like you flew into some serious wind shear" I asked him if he was a pilot and he said yes. Unfortunately right after this the EMS and police offices where around me and asking me questions and I did not see or get to talk to this guy again. I want to look at the landing strip while flying upwind for obvious reasons, I guess it is also possible that the 15 MPH headwind may have dropped to zero after I completed the turn.

While loading the aircraft the owner of the land and his friend talked to me. Without telling them any details they told me how the winds in the area that we were standing were extremely erratic. I also observed a large dust devil against the mountain. The land is sloped by the mountain so it was dry., but as it moved to the flat ground which was wet you could not visibly see it because it was not picking up dust. Although I do not know exactly what happened I strongly feel there was some other force (probably environmental) acting on the aircraft and making it behave in a way that it had not behaved in the last 280 hours.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Flying the airplane faster and higher would have helped. But at some point you always have to descend and slow an airplane.
