NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On January 26th 2016 at 20:15 I started my takeoff roll on runway 25 at KLZU, At the moment of rotation I noticed two deer running at speed from right to left across the runway. I pulled up rapidly in an attempt to avoid them however one of the deer impacted the nose-wheel. After the impact I initially reduced power with the intention of setting back down on the runway but realized the red gear unsafe light for the nose wheel was illuminated as well as the gear horn when the pcl was at idle. After a quick consideration of my position down the runway the altitude I had gained trying to avoid the deer I wasn't sure I would be able to settle back down and stop without running off the end. I advanced the power control lever and observed no abnormality's with the engine or prop vibration I also didn't believe the deer had made contact with the prop so I made the decision it would be safer to continue than to attempt a landing leaving the gear selector down and the flaps at 15 degrees. I advised the tower I would be climbing and orbiting the field, and requested to get Fire/EMS to the airport and to have someone remove the deer from the runway. While circling I pulled the Hydraulic power pack circuit breaker as a precaution to keep the pump from running, I also tried the emergency gear extension handle following the procedure in the Quick Reference Handbook to see if I could get the green light on the nose gear. I had the tower request a second runway inspection to ensure nothing had fallen off the airplane, I followed this with a low approach over the airport to have company pilot take a look at the gear both he and the tower reported that the nose landing gear appeared to be intact and in the down position. After communicating with my operations we decided to continue orbiting while they got resources together to move the aircraft off the runway after landing, and discussed the landing procedure referenced in the QRH with the director of operations. At approximately 2150 everything was in place. On the downwind I turned off the ECS and and pulled the ECS Emergency shut-off. On final I selected 40 degrees of flaps as per the QRH At the moment the main wheels touched down I pulled the condition lever to cut off feather and pulled the fuel emergency shut off, kept back pressure on the yoke to allow the nose-wheel to settle as softly as possible, Pressed electrical shutoff bar to turn off all electrical power and allowed the airplane to coast to a stop without the use of brakes and evacuated.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

In conversation with the airport manager I learned that the deer population has increased on the airport because of hunting pressure in the surrounding areas.

The fact is that wildlife strikes are one of the most difficult things to predict. It is a problem that can be dealt with proactively through accurate reports from the airport users and airport management establishing a program of regular wildlife population control.

Reporting wildlife activity is probably the most important element of this proactive approach. Without these reports airport managers cannot properly gauge the amount or timing of their response.
