Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Right landing gear collapse, lower airframe and firewall damage. Tailcone, stabilizer damaged. Tail rotor blades ground contact and severed leaving approx 5" of T/R blade(s) attached to T/R hub. Both Main Rotor Blade tips sustained ground contact damage. Additional airframe, fuselage, drive system damage, however aircraft did not roll over and remained upright.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Flight instructor and student took off at approximately 08:15PDT for a local airport traffic pattern flight lesson. The intent of the lesson was for the student to conduct his first solo. Once in the traffic pattern, and on final approach, the student (with CFI onboard) initiated a go-around. The second traffic pattern was initiated, and terminated with a normal approach to a 5' hover, followed by a landing from a hover.

The CFI briefed the student for the solo hover, takeoff, traffic pattern, approach and landing, and then exited the helicopter. The CFI walked to the edge of the runway to visually (and via handheld radio) supervise the student for his solo operation. The student lifted off to a stabilized 5' hover, conducted a clearing turn, performed a normal takeoff from a hover and proceeded into left traffic. During final approach, the student initiated a go-around stating he was "too high and too fast" for a normal approach. On the second solo traffic pattern, the student conducted a normal approach to a 5' hover.

The student attempted to land (commonly known as a "set-down") from the 5' hover. The student lowered the collective with greater downward pressure than normal and the right skid tube contacted the ground with more force than normal. The student quickly pulled the collective up in an attempt to return to a hover. However, the rapid increase in collective and power added torque which began a rapid right yaw. Insufficient anti-torque tail rotor input was made and the helicopter spun to the right for approximately two revolutions. During the second revolution, the tail rotor vertical stabilizer and both tail rotor blades contacted the ground. This resulted in a complete loss of tail rotor control. The student then forcefully placed the collective full down. The right lower airframe and right skid tube collapsed causing the helicopter to tilt to the right. The main rotor blade tips contacted the ground. the helicopter came to rest upright, in a lean to the right due to the skid and lower airframe collapse. The engine was still running, student rolled the throttle to idle, pulled the fuel mixture, and turned the fuel valve off. The student applied the rotor brake and stopped main rotor rotation. The CFI responded as the student exited the helicopter through the front plexiglass (bubble) which had popped out of its frame during the event. The master battery switch was shut off by the CFI.

Authorities were summoned by the Riverside ATC Tower. There was no fire. The student received no injuries.
