Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Right gear leg detached; damage to rear spar, right wing; Slight damage to airframe; Windshield broken; Prop strike on both blades.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On short-final approach to runway 22L, the aircraft was slightly high above the runway threshold elevation. I retarded the throttle completely, pulling the throttle against the stop. The aircraft was crabbed slightly to the right to compensate for the reported wind direction. On short final, the crab was removed so the aircraft lined up with the runway center-line, and the right wing was lowered slightly to execute a crosswind landing in the wheel landing configuration. Upon touchdown, both main-gear wheels contacted the runway surface at the same time, with the right wheel just to the right of the center-line. At that point the aircraft drifted abruptly to the left. I added right rudder in an attempt to bring the aircraft back toward the center-line, but even though the right rudder was fully deflected the left wheel of the aircraft exited the runway. At this point, the aircraft ground-looped counter clockwise to the 90-degree point. Then the right side of the fuselage contacted the airport's 'Taxiway C' identification sign. The impact collapsed the right gear strut. The right wing contacted the dirt and the aircraft slid to a complete stop. I exited the aircraft immediately, turned off the fuel and master switch for the electrical system, and stepped away from the wreck.

At this point, I noticed that both windsocks in view were indicating winds from different directions at different relative velocities. At the far eastern part of the airport, the Heliport sock was indicating a southerly wind of approximately 10 knots while the airport windsock, placed further to the west, was indicating a wind direction and velocity of about 240° at 8 knots. As I continued to watch, the Heliport sock turned in clockwise fashion to indicate a northerly wind of 10 knots, lasting about a minute. Over the following minute, the wind diminished slightly and the Heliport sock swung to indicate the wind from the southwest.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Better reporting of wind shear to inform pilots of variable winds. Incorporate more measurement stations and wind socks on the east and west perimeters of runways.
