NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Fort Worth Center switched me to Kansas City Center approx 50 nm from KSWO. Kansas City Center received me and advised me to notify KCC when I had KSWO insight.

N2663X "Kansas City Center Cessna-two-six-six-tree-exray has kilo-sierra-whiskey-oscar, Stillwater insight on my 12 o'clock."

KCC "N2663X Squawk VFR frequency change approved, contact Stillwater Tower on 125.35, good day."

N2663X "Squawk VFR, frequency change approved, contacting Stillwater Tower on 125.35 November-two-six-six-tree-exray, good day."

N2663X "Stillwater Tower, Cessna-two-six-six-tree-exray with you inbound ten miles to the east at three-thousand five-hundred."

KSWO Tower "Cessna2663X enter a midfield left downwind for runway one-seven."

N2663X "Cessna-two-six-six-tree-exray entering a left midfield downwind for runway one-seven."

I descended to 2,500' MSL gradually over 6.5 nm until entering appropriate traffic pattern distance, then descended to 2,000' and executed my before landing checklist.

KSWO Tower "six-tree-exray winds are one-five-zero at fifteen knots."

N2663X "Winds one-five-zero @ fifteen knots, six-tree-exray"

On Base 20° of flaps, airspeed 70 KIAS, mild chop 15 knot tailwind

N2663X "Stillwater Tower Cessna-two-six-six-tree-exray would like to confirm clearance to land on runway one-seven."

KSWO Tower "Affirmative six-tree-exray you have clearance to land on runway 17."

Turned final implemented 30° of flaps, airspeed approx 67-69 KIAS to counter the left quartering headwind. Tower issued a second wind report via radio transmission, approx 1,000' horizontal distance to TDZ, either I did not receive the transmission or I did not hear it. I learned later Towers transmission read 120 @ 16 knots gusting 21 knots, these winds are clearly out of component for runway 17 and at that point if I heard the transmission, executing a "Go-Around" is mandatory and diversion back to Riverside or a hold in traffic pattern would have been necessary. Neither of these happened clearly and I continued my descent to land on runway 17. I crossed the TDZ and pulled back the throttle from 1,500 RPM to 1,100 RPM, upon entering ground effect I pulled the throttle to idle and waited to sink before my flare. During the transition from crossing the TDZ and into ground effect, the crosswind I had encounter through my glide slope had increased considerably. A stabilized approach was maintained throughout my descent and touchdown was gentle and just shy of the center-line on the right side. At this point, I was confident everything had been executed smoothly, although I felt 20° flaps would of made control much easier. Immediately after touchdown I used some gentle left rudder and equal braking pressure to realign myself to the center-line of the runway. After touchdown the aircraft was rocking slightly forward and aft on it's horizontal axis and just after I implementing left rudder I had lift off, I was under left rudder control and the aircraft was rotating right on its longitudinal axis while aiming left back towards the center-line. I implemented left aileron controls and held my slight left rudder control. The aircraft stalled and fell approx 3 feet back onto the runway, except heading 20° to the right of the runway heading. The aircraft touched down at what I believe to be 3 feet per second and with minor right side loading. I tried to counter a second bounce with braking and level elevator fearing with the amount of braking being applied I would roll or slide if I used too much left braking or left nose gear/rudder controls. After that attempt I still bounced and became airborne a second time, wings were level and left rudder implementation held. I passed the boundary of the runway on the right side and touched down in the grass. The aircraft was stable and I used as much elevator as possible to relieve pressure off of the nose gear. The aircraft was now stable and rolling under medium braking at 40 knots. I identified a runway sign approx 80 feet ahead and increased braking and left rudder control while maintaining crosswind control. I passed the sign under my right wingtip and attempted to exit my left turn after wing, strut, and main landing gear clearance to the right to avoid impact to the right horizontal stabilizer. The aircraft was moving at approx 30 knots, under moderate right rudder, moderate right braking, and nose down elevator failed to turn the aircraft in time or raise the tail in time to avoid striking the 2,000' runway remaining sign on the right horizontal stabilizer. ATC asked if I needed assistance and if I was able to take a look at what I hit. I asked for taxi instructions after getting back on the runway to view the sign and confirm with ATC what it was.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Failure to receive the updated winds induced an unsafe condition on the student pilot. The student pilot comfortably landed the aircraft and after lift off became a passenger. At the point of the unintended initial lift-off a go-around should have been executed. Adequate remedial training has been completed and the student pilot has agreed to speak in-front of the student body. Morale of the story, unsafe? uncomfortable? losing control of the aircraft? perform a go-around.
