Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Both left wings badly damaged/destroyed, left main gear detached & folded under fuselage, prop destroyed, bottom of cowling crushed, damage to bottom of fuselage.

Long arcing (to NW) intermittent gouging furrow from left landing gear wheel in the sod runway / taxiway area.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

First, in my opinion, the Waco YMF-5C aircraft has the best tail wheel landing gear I've ever experienced. It is so stable, smooth & well tuned that it is difficult to determine when the aircraft actually makes ground contact while performing either wheel or 3 point landings.

Saturday 5/7/2016, Intend to stay in pattern @ J22-Ranch (16FL) airport for practice take offs & landings. Obtained weather from USN Whiting Field ASOS (850 623-7210) @ 16:45 & 17:15 cent. time. The 1st was 3kts from 360, the 2nd was light & variable.

Taxied to Rwy 18/36 while setting elevator trim to T/O posion, then did medium speed (tail down) taxies North & South in center of runway to set my peripheral vision, did a normal run-up with all systems checking good, rechecked the wind sock at the SW location (it was limp), then took center of rwy 36, turned on boost pump, locked the tail wheel & ensured it was locked by wagging the rudder. Smoothly applied power while maintaining center line with the tail down, as I approached 40mph with full throttle I eased forward on the stick to raise the tail at the same time applying the required amount of right rudder. As the tail came up the aircraft started a strong swerve to the left (West) which increased in intensity? I applied full right rudder and it continued the left swerve while still accelerating, I then also applied a significant amount of right aileron at which time the aircraft started surging (for want of a more descriptive term) in both directional & elevator control effect. Almost as if the aircraft were skipping along while grabbing to the left & slightly lowering the nose & then accelerating a little bit to the right while raising the nose. I was headed towards my Neighbors hanger on the west side mid field & felt it skip/accelerate again and start to become airborne at far too low of a speed. I made the decision to pull the throttle back at which time the aircraft dropped the left wing which dug into the turf and slammed the aircraft around to the left into what I would call a ground loop.

The aircraft slammed hard while pivoting to the left and came to a stop pointing back down the runway at approximately a 200 to 220 degree heading with its left side bottom wing on the ground. The ELT had fired, the engine was still running (with a shattered prop) and fuel was pouring from the upper left wing. I secured the engine, turned off the boost pump, ELT and electrical system prior to releasing my harness and exiting over the left cockpit side.

The very first thing I did after exiting was to go back & check the position of the elevator trim jackscrew (because of the pitch oscillations I had experienced), the jackscrew was in the normal take off position.

Both of the left wings were damaged, the left landing gear was torn loose and under the fuselage, the lower cowling was crushed, & prop shattered. In the back of my mind I noticed the intermittent gouge in the turf from the left wheel in a left arc but didn't pursue it as I was busy calling friends & neighbors for help. My friends arrived to help secure the aircraft & get it back to the hanger, about 1/3 mile away. My neighbor/friend carried the cowling (removed to hoist) and the left gear assembly along with other loose parts back to my hanger with his Kubota & trailer.

I called & reported to NTSB the following day, Sunday 5/8/16.

I took iPhone pictures of the damage and accident site while there was still some available light, the following Monday 5/9/16 I returned to the accident site and took more pictures of the left arcing gouges the left main wheel made in the turf. I have since provided these photos to NTSB, Birmingham FSDO FAA Aviation Safety Inspector Nina McBride, & ILM Insurance Adjuster Harry Brooks.

FAA Av. Safety Insp. Nina McBride called me Tuesday 5/10/16 as I was en route back to the airport. She arranged to meet me Thursday 5/12/16 @ 9am. She had many questions, one of which was "what kind (mfg) of brakes did it have?, I didn't know the name brand. However, her question triggered my memory of the hard swerve to the left. When I got to the hanger one of my helpers had already opened up. I immediately went to the left main landing gear my neighbor had off loaded next to the engine cowling on the floor. The wheel pant was torn up pretty good but the tire was still inflated. I reached down and tried to rotate the tire, it was locked solid. I could see no apparent damage to the wheel/brake assembly itself, I took pictures as my neighbor arrived. He also tried to move the wheel with no luck. I cautioned him to not try to force it as I wanted it to stay the way it is. It answered a lot of questions in my mind!

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I can't imagine how I could have prepared myself for such an event.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Not sure, appears that L/H landing gear wheel/brake assembly is locked up. Requires further investigation. I understand the Birmingham FSDO will be investigating.
