Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left and right landing gear collapsed; Propeller shattered; Carburetor sheared off; Left exhaust stack bent; Left wing strut bent.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I departed Enterprise Airport (KEDN) for 54J at approximately 0730 CDT. I was flying there VFR without a flight plan. I obtained a preflight briefing for the flight from 1800wxbrief.com around 0700 CDT. The weather for KEDN, 54J, and the route of flight was VFR (Vsbys 10, Sky Clear). As I recall the winds at 54J were 350/04. Notams indicated that Rwy 18-36 was closed for the Marvel of Flight Fly-In and the preferred Rwy was 27 with right traffic.

About 10 miles from 54J I announced my inbound intentions on 122.8 (Unicom) and someone stated that they were using Rwy 27 with right traffic and that there were several aircraft in the pattern and inbound. No wind information was passed. I announced my entry to the downwind at about 3 miles northwest. I heard several aircraft make position reports inbound to the airport. At midfield I made a position report and a Cessna reported 5 mile final to Rwy 27. Just prior to turning base I asked the Cessna where he was and he reported a 1.5 mile final. I stayed on downwind until I saw him and then turned base to follow him in.

Once I was established on final I needed to use more right crab than I expected so I determined that the wind had increased since the last report that I had. I did not know how much crosswind there was but I estimated about 8-10 kts with gusts to 15-17 kts coming out of the north. As I got down to around 100 feet there was a lot of turbulence so I used some additional speed to compensate for the crosswind and turbulence.

As I touched down the crosswind started causing me to drift to the left. I made right rudder input to correct back to centerline. As I was doing this a wind gust lifted my right wing causing the start of a ground loop that was going to take me off the runway surface. As the ground loop was developing I could see a drainage catch basin just off the edge of the runway that was about 40' X 40' and maybe 10' deep and I was heading straight for it. I knew if I continued into the catch basin I could be seriously hurt so I added full power to try and fly out of the ground loop and go around with full power. Unfortunately the aircraft was too slow to get a positive rate of climb. The aircraft had enough momentum with full power to keep from falling into the hole but still caught its right wheel on the lip of the catch basin. The impact collapsed the right gear and caused my aircraft to spin to the right. The prop hit the ground and shattered. The side load on the left gear caused the main tube to bend and collapse. The aircraft slid backwards for about 30' and came to rest facing east.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The large catch basin holes that are approximately 10' from the runway edge are a hazard. Had there been a 50' level or gradual slope at the runway edge to accommodate drainage the ground loop would not have ended in an accident.
