Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft totaled. Nose and one main gear sheared off. Both wings destroyed. Windshield broken. Engine separated from its mounts. Only the tail empennage appeared to remain intact.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Departed KCOE at approximately 8:30am on June 1. Our destination was Moose Creek airstrip in the Selway/Bitterroot wilderness area, with a stop in Elk River, Idaho, for breakfast. We were departing Elk River at 10:30am. The 17/35 grass/gravel runway has a hill off the south end and an open meadow to the north. I had flown into Elk River before and always preferred the north departure to allow a few more immediate emergency landing options on takeoff. The windsock showed a slight but variable tailwind for takeoff to the north, estimated at just 2 to 3 knots. But with the temperature, aircraft takeoff weight, 3000 ft runway length, and 230 hp available, I determined that a takeoff to the north would still be the safest choice. After our runup, I chose to do a soft field takeoff procedure, requiring yoke back, nose up, flaps 20 and full power. On takeoff roll I noticed the aircraft accelerated slower than normal, but not unusual for a soft field takeoff. As per the procedure, I was to wait for the airplane to break ground, then immediately lower the nose to accelerate. While still on the runway and at approximately 45-50kts, I got the stall warning horn, which is also not unusual, initially, for a soft field takeoff. However the airplane failed accelerate any further. At about the time I would abort the takeoff, the airplane finally became airborne but at a speed unable to sustain continued flight, even with the nose lowered. It wallowed its way to 20-30 ft in ground effect then stalled in a wings level, slight nose high attitude, with approximately 40kts forward speed. The airplane made contact with the ground, skidded approximately 30 ft, and came to rest with its nose canted slightly to the left, about 50 ft off the end of the runway. Once the aircraft stopped, the key was turned off and removed, master power switch turned off, and we exited the aircraft as quickly as possible. Once we cleared away from the aircraft, we noticed that the tailwind was more significant at the departure end of the runway than indicated by the windsock at the initial takeoff end. My own post accident assessment tells me that the soft field departure procedure may have been a detriment to a safe takeoff by exaggerating the effects of an increasing tailwind.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

1. Pilot should not have used the soft field takeoff procedure.
2. Considering the runway length, the pilot should have transitioned to a normal takeoff attitude, lowering the nose, as soon as it was evident that the aircraft was not accelerating normally.
3. Pilot should have aborted.
4. If knowing that the tailwind was higher at the departure end, a takeoff to the south would have been better
