Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left wing tip destroyed, left wing damaged to 2nd rib from wing tip, left aileron damaged, left stabilator half damaged

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

"Flight Crewmember 2" is the aircraft owner and was not flying at the time of the accident.

Practicing landings at Grants Pass, 3S8. First 3 patterns accomplished on runway 31 with an 8-9 kt left crosswind. Left seat pilot (not flying at the time of the accident) is current in the aircraft. Left seat pilot accomplished first landing. Right seat pilot accomplished the following takeoff and landing. Left seat pilot accomplished following takeoff and landing. Wind sock indicated that wind had shifted to favor runway 13 with an 8-9 kt right crosswind, shifting from right quartering headwind to direct crosswind. Right seat pilot accomplished a downwind takeoff on runway 31 and changed to a runway 13 pattern for landing. On left downwind for runway 13 a radio call was heard from an aircraft reporting downwind 13 at Grants Pass. The pilot flying asked the reporting aircraft to verify its location. There was no response. With concern of another aircraft in the pattern, the pilot flying, right seat pilot, departed the pattern to the east. Someone from the Grants Pass FBO transmitted that he was working on the pilot controlled AWOS and that the transmission heard in the aircraft was actually a recording of its own report on downwind. With the traffic situation reconciled the pilot flying reentered the pattern with a wider downwind and base leg than normal. Pilot flying established a final approach with an airspeed of 60 kts and 30 degrees of flaps for a wheel landing. Final approach configuration and airspeed was stabilized prior to 700' AGL on final approach. Normal touchdown but as the aircraft decelerated and the tail was being lowered to the ground a wind gust from the right started a right swerve that ended in a ground loop as the left main landing gear left the runway surface and "dug" into the ground at the edge of the runway. The aircraft came to rest almost perpendicular to the runway, off of the runway surface. The left wing and stabilator contacted the ground during the ground loop. No damage to the landing gear or other aircraft components.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

3 rows of T hangars sit perpendicular to the runway abeam the landing touchdown spot. It is possible that wind funneling between the hangars was accelerated and initiated the swerve to the right. Local pilots commented that there have been numerous occurrences of conventional gear aircraft experiencing ground loops at, or near, that spot on the runway. Recognition of ground environmental hazards that might affect wind intensity might have prevented the accident/incident.
