Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Substantial damage to both wings and nose of aircraft. prop substantially damaged . Tail also Damaged extent due to impact unknown as some damage incurred during recovery from water. Substantial non structural damage done to aircraft due to submersion in water. No damage to the property of others.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

On Wednesday 7/6/16 at around 1330 EDT I was returning the airplane to our home on Merrymeeting Lake in New Durham New Hampshire after having the floats installed at Twitchells (3b5) in Maine a little earlier in the day. I departed 3B5 on the river a little before 1300. After making two uneventful touch and go water landings on a nearby lake for currency I proceeded toward home. On arrival at Merrymeeting Lake the weather conditions were excellent VFR and the winds reported by the AWOS at KLCI were given as 240 at 7 gusts to 14 as I remember. The wave forms on the lake were consistent with that report as I circled once over the lake to check for traffic and conditions. I selected a familiar stretch of water free of boat traffic for my landing along the lake's north shore .One I have used numerous times.

The approach into the wind was completely normal on speed and stabilized using the power assisted decent technique during the final stage of the approach. My last observed airspeed was about 58Kts as I began shallowing the decent for the flair about 10ft above the water. . Immediately upon touch down the airplane veered sharply left dug in and was uncontrollable. The departure from the controlled flight envelope was so quick my first impression was that something had failed in the float system. This on later inspection does not seem to have been the case. After a complete upset which seems to have been a "water loop".(That is right wing contacting the water followed by left wing contacting the water as the airplane pitches down and over into an inverted position.) we came to rest indeed inverted. .

Fortunately I was conscious and unhurt and was able to release the seat belt gain some situational awareness and wait for the cabin to mostly fill with water at which point the decreasing outside pressure allowed me to open the right cabin door and exit the aircraft unscathed .

A nearby boat owner came to my assistance shortly thereafter.

I feel at this point that possibly an unseen wake generated by the specially designed heavy wake producing boats operating now daily by a ski school on our lake may have been a factor in this mishap. These unusually large and steep wakes used for "Wake Boarding"have the characteristic of remaining in existence for long periods . Sometimes persisting at long distances from the vessel that propagated them. In my experience I have encountered them by boat with no other vessel in sight. The light chop created by the 7 to 14 kt breeze at the time of landing could well have masked such a wake leading to the upset in my opinion.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The reading of many fine articles regarding what to do in a seaplane upset were a great resource to me when I actually was confronted with the event. Although I was of course shocked and plenty fearful after experiencing a sudden unexpected ride in a tumbling airplane followed by being upside down in one that was sinking those articles and their advice were there to guide me in what to do and expect. They helped me stay focused on a course of proper action. Become situationally aware. Expect to be inverted. Release the belt as soon as you are oriented and know where the door is. Expect to be unable to exit at first because of pressure. Do Not inflate or try to put on life jackets in the airplane. Thinking of these tenets banished any panic or wasted efforts.

I have been to a couple safety seminars for seaplanes. Egress after upset was not discussed. No doubt this is not always the case but seaplane training should include the discussion of this eventuality when ever possible since it is probably one of the most survivable accidents and one of the most common.
