

NATIONAL TRANSPORTATION SAFETY BOARD PILOT/OPERATOR AIRCRAFT ACCIDENT/INCIDENT REPORT

This form to be used for reporting civil and public aircraft accidents and incidents

BASIC INFORMATION

Accident/Incident Location

Nearest City/Place: Lewistown State: MT
 ZIP: 59457 Country: USA
 Latitude: 46:46.8N Longitude: 112:39.9W
(Enter in decimal degrees or degrees:minutes:seconds)

Accident/Incident Date/Time

Date: 08022016 Local Time: 1630
mm/dd/yyyy Time Zone: MDT

Collision with Other Aircraft: ☐ Midair ☐ On-ground ☒ None

AIRCRAFT INFORMATION

Registration Number: N734GM

Manufacturer: Cessna

Model: 172

Serial Number: 17268843

Year of Manufacture: 1978

Amateur-Built: ☐ Yes ☒ No If Yes: ☐ Kit/Plans ☐ Original Design Make: _____

☒ IFR-Equipped and Certified
☐ Commercial Space Flight
☐ Unmanned Aircraft

Maximum Gross Weight: 2550 lbs

Weight at Time of Accident/Incident: 1900 lbs

Number of Seats: 4 Flight Crew Seats: 1

Cabin Crew Seats: 2 Passenger Seats: 3

Number of Engines: 1

Category of Aircraft

- ☒ Airplane
- ☐ Balloon
- ☐ Blimp/Dirigible
- ☐ Glider

Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Propeller, cowl, exhaust pipe, left aileron and flap, both wing struts, empennage damaged. The fence and gate that was struck was also damaged. No other property damage occurred.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

At approximately 16:30 MDT (2230Z) on 2 August 2016, there was an incident at MT65 (Smithfield) near Lewistown, MT involving N734GM, a Cessna 172 with an AirPlains 180 HP conversion. Weather conditions were clear at the time with winds from the north gusting to 10-15kts. Temperature was approximately 33 degrees Celsius. I, Scott Taylor, was the sole occupant and had approximately 80 pounds of baggage and gear distributed throughout the aircraft cabin. There were approximately 30 gallons of fuel in the tanks.

I decided to depart to the west, although slightly in downwind conditions, because of the 2% downgrade slope of the runway, along with the lack of terrain obstacles in that direction (there is severe upslope due to mountain terrain to the east). After startup and runup, I taxied to the extreme eastern edge of the runway. At this end of the runway, I engaged the toe brakes, advanced to full power, and leaned to mixture for ideal EGT at 75 degrees rich of peak. When satisfied with engine performance, I disengaged the brakes and began takeoff roll.

Upon reaching approximately 30kts as indicated by positive airspeed indication, the pilot seat slid back a few inches, coming to a stop, either because of hitting one of the track detentes or arrest by the belt mechanism. In an attempt to move the seat forward, I engaged the seat adjustment, causing the seat to move to the full aft position. This caused me to pull back on the yoke, and the nosewheel came off the ground. The aircraft began to swerve to the left, striking a fence and gate adjacent to the runway. After colliding with the fence, I continued to roll, with pieces of the fence and a gate now entangled in the landing gear, and came to a stop approximately 50 meters beyond the point of collision. By this point, I had also pulled the mixture to full lean, and turned off the ignition and master switch.

The resulting damage was significant to the propeller, left aileron, both wing struts, and the empennage. There were no injuries to myself whatsoever, and I was able to exit the airplane without further incident.

The aircraft was then towed and tied down near the east end of the runway near the hangar at the airstrip.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The slight movement of the pilot seat aft during takeoff roll was inconvenient. Had I done nothing at this point, it most likely would have been a manageable situation. My reaction to move the seat forward using the adjustment bar during takeoff roll acceleration is what caused the pilot seat to move to the full aft position. At this point, I had no control over steering due to the distance from the rudder pedals.

The rapid movement of the seat to the aft position was clearly the most critical factor in this incident. A possible recommendation to prevent this occurrence in the future could be pilot instruction to simulate what happens when the seat adjustment is engaged during acceleration. This is something that will never happen to me again - but the lesson was a painful and expensive one. I am familiar with similar events that have had much more tragic outcomes.

One recommendation would be for pilot seats to have positive traction at all times, perhaps by a screw mechanism that would allow for the seat to be adjusted for convenience, but that would preclude the risk of severe movement either fore or aft during acceleration/deceleration. Another suggestion might be to have specific placarding against using the adjustment bar during critical phases of flight.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
