Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Prop twisted. Sudden stop to motor requiring overhaul. Right main, and nose gear sheared off. Right tire flattened. Minor buckling of firewall and structure. Dents in lower cowling and fuselage. Minor bending in both wing tips with fiberglass tip torn off of left wing.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Since we endeavored to embark at 06:00 Eastern time from 7B2 Northampton Massachusetts, we checked all NOTAMS before that time. Our departure was delayed until 09:00 Eastern due to fog, before which we double checked weather before departing. We spoke to Flight Following the entire trip, and made a fuel stop on our way westward to SUW Superior Wisconsin at N27 Towanda PA at 11:30 Eastern. We continued to FKL on flight following until we were transferred to Youngstown who told us of the NOTAM closing runway 3-21 while we were about 10nm from the airfield, which was also when we were able to receive the weather reports of winds from 210 degrees at 9 knots gusting at 18.

We noticed and listened to a Cessna in the pattern for runway 30 and decided to match that pattern. We entered Downwind for Runway 30 at pattern elevation and prepared for a crosswind landing, pulling out the carb heat and reducing RPM to 15,000 as per my flight instructor Longhao Chen's recommendation. Longhao also insisted that we increase flaps by ten degrees in each part of the landing pattern, ending at 30 degrees, which I personally believe was an error in the crosswind conditions. Radio calls were made at each part. We descended in line with the runway crabbed at an angle of 30 degrees to the left, into the wind. We were not able to descend quickly enough with the 30 degrees of flaps and nearly touched the runway past its intersection with 3-21 which was when I kicked the right rudder to remove the crab angle of 30 degrees and land in line with runway 30. Before we finally touched the runway we gusted off runway 30 at no power and about 25 knots of airspeed to just above the grass adjacent the runway. I pushed the throttle all the way in to regain control of the aircraft and go around. The engine responded, but with the carburetor heat still on, and the flaps at 30 degrees and the temperature of nearly 80 degrees Fahrenheit outside, we did not regain control of the aircraft which had pitched helplessly upward. The left wing tip struck the grass and came off, pitching the aircraft to the right, where the right main gear and nose gear made contact with the grass and sheared, allowing the prop to strike along with the right wing tip. I shut off the magnetos, radio, lights, transponder, master switch and fuel selector and Longhao and I removed our 3 point restraints and exited the aircraft via our doors.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

We could have decided to alter our course for refuel to another nearby airport, which would have been best.

It would have helped if the NOTAM about the runway closure had been issued sooner than the morning of.

We should not have used flaps, they reduced our airspeed and control too much.

We should have landed with some power on for control and used as much runway as necessary, rather than trying needlessly to do a classic approach to use minimal runway.
