Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Both Left and Right Wing outermost areas have substantial damage, which caused a problem in the root of the wing, specifically the area of connection to the fuselage.

Nose cone damaged, and prop strike into creek bed wall.

Undercarriage light damage, but one wheel pant destroyed.

Upper and Lower cowling with significant damage.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

N204AK - Accident Report - KSSI - August 22, 2016

On August 22, 2016 at 8:50 am N204AK had completed preflight, had local weather through ASOS (120.25) and via Unicom Frequency (123.05) announced taxi from hangar 6 to active Runway 22. To the right of the hold short line of Runway 22, a Standard Run-up was performed to include 2000 rpm detent, and full magneto drop and recovery of 100 rpms, and all systems (Flight, Engine, Fuel and Annunciator panel) checked and verified and in the Green, All systems Go. No other traffic was observed in the area. Fuel select was on the left tank (22 gals) with right tank (20 gals). The Pre Take-off checklist was accomplished at 0900 and The Pilot, Kenton Charles Harrison, announced via Unicom that N204AK was taking Rwy 22 for a left turn departing to the south. N204AK back taxied to the chevron area of the threshold of Rwy 22 and full power was applied, N204AK was on the roll for a standard departure on Rwy 22. At 70 kts all pressures and temperatures were in the green, and the nose wheel was eased back. At 80 kts rotate was accomplished and the main wheels lifted from the ground. All systems continue to be go. Standard rate climb of 90 kts was accomplished and N204Ak climbed to approximately 150 feet. At this time, the engine stopped. The propeller continued to windmill, and a clear liquid continually sprayed from the upper cowling across the front windshield (presumed to be fuel). The Pilot immediately attempted a landing back on Rwy 22, added full flaps and slipped the airplane back to Rwy 22 below. An attempt to land as soon as possible was accomplished, and once on the ground, the brakes were immediately and heavily applied. Once approaching the end of the Rwy 22 and not able to stop, the Pilot noticed automobile and pedestrian traffic ahead, and opted to break heavily to the left and deviate from continuing straight towards the traffic. Consistent breaking and skidding continued until N204AK hit the perimeter fence in the SW corner and coming to rest in a ditch with significant structural damage. The pilot was not injured.

The Pilot was able to exit the aircraft, which was now in a creek bed, a small tree and a portion of the airport perimeter fence. Significant damaged was sustained to the airplane, and emergency vehicles were dispatched. Later in the day, a crane lifted the plane out of the creek and was towed to a hangar. The undercarriage was completely operable.

At the hangar, the cowling was removed by Palmetto Aviation, and determined that the cause of the accident was a Loose "V" nut, on the main fuel supply hose.

RECOMMENDATION (How could this accident/incident have been prevented?)**Operator/Owner Safety Recommendation**

As a Pilot (who is also a Husband and Father of Three Terrific Children), I use this airplane as a means of safely commuting to my office in South Miami Florida, from my residence in Saint Simons Island GA, typically on a weekly basis (430 nm). I have embraced learning about the elements of flight, and specifically mechanical safety as I am often enroute over aspects of the ocean. And thus, I have not stopped learning from Annual inspections, Observations, Oil and Oil Filter analysis, as well as often changing the planes oil and filter and a once over inspection.

To answer the question, I do not believe it is feasible for me to do anything additional which might have prevented this type of accident. In retrospect, the only thing that would have saved this accident from happening would be to Torque test each fitting on the engine, and this is not practical. Therefore I must entrust my A&P implicitly.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)

Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

The Main Fuel line nut was loose at the "Spider" junction. After the accident, the fuel system was activated and fuel sprayed from the fitting. Once hand tightened one half of a revolution, there was no leak. The nut was hand tight at best.

The plane was just released from Palmetto aviation for service, replacing the Alternator #2 and clutch.

Once the plane came to rest in the creek, I was able to open the door, turn off all electrical power, turn off the main fuel line, and climb up the creek bank (greeted by an 8 ft alligator). Fuel was coming out of the Left vent, as the plane was listing to the left. There was no fire.
