Hi Michael,

We have the results from the DNA and microscope examinations for Conf.# 2016-714-151710. We did not find any feather evidence in any of the 8 samples with our microscopic examinations. We did get one bird identification for sample #8 (swab from r/h pilot's windshield and frame) but this was a very small bird. The DNA matched Western Kingbird (*Tyrannus verticalis*). Due to the damage caused in this event, it is our opinion that this sample was likely an old strike that was not previously reported. We did find insect debris in several of the samples. We will enter the information into the FAA Wildlife Strike Database. Let us know if you have any questions. Good luck with your investigation, Carla

Roger that.
Thank you very much.

Respectfully,

Michael Hicks
