Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The engine was pushed into the cockpit, the nose of the plane was crushed and windscreen destroyed, the instrument panel was destroyed and displaced by engine. Both doors came off and the wings were damaged when the plane inverted.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

At 8:20 am on October 12, 2016 I arrived at KHNB for a morning pleasure flight. The weather was clear with 10sm of visibility, 6 knots at 150 and 536 density altitude. I pre-flighted the airplane, added .5 qt 20-50 aerotech oil and confirmed 14 gallons of 100 LL. I cleaned the windscreen as it was covered with bugs from previous flight. I chocked the wheels and tied down the tail, primed the engine twice, turned prop through two complete cycles (8 revolutions) and started engine via had propping on first pull. I let engine idle for approximately five minutes, untied tail, removed wheel chocks and taxied to ramp. Once at ramp, I checked instruments, controls, set GPS and fore flight on cell phone. I did a run up to 1600 rpms, checked mags and carb heat, as well as oil pressure and egt. I checked AWOS and weather again prior to taxi to 270. I did a second run up as done previously, called Unicom on 122.8 and proceeded to runway. I accelerated with throttle over approximately 3 seconds and had a smooth take off. I flew for approximately an hour at 4000 feet. The flight was smooth and uneventful. I returned to the airport and called Unicom to check traffic. When I descended to pattern altitude of 1537 agl I noticed the wind had picked up considerably and was almost perpendicular to runway. I decided to do a fly over and did so at about 20 feet agl. I felt the airplane was steady and went around again to make final landing. I touched down on centerline, with all three wheels on ground at about 48-50 knots. When I made contact with the runway, a gust of wind lifted the left wing, which I tried to compensate for with ailerons and throttle, but I was too slow to regain control of the plane. The left wing of the plane dipped and touched the ground and I landed on the nose.

NOTE: I received a copy of the AWOS transcript that showed the wind conditions when I left the airport as stated in the narrative. When I returned, the wind was 16-18 knots sustained with gusts to 22 knots perpendicular to runway(S).

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Have a runway that runs North and South to avoid extreme crosswind landing conditions. This airport actually used to have one.
