Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Prop strike, windshield broken, left wing struts and multiple ribs broken, right wing tip damaged, vertical stabilizer damaged. Unknown rear fuselage damage (cloth skin shows notable signs of stress)

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Origination from Hangar #7 at WN26 in Palouse, WA at approximately 11:00PST, 31DEC2016

Aircraft was preheated, preflighted, and started. Aircraft was taxied to position on runway 22.

Pilot noted the drifted snow and ice crust and the moderate cross wind from the left.

Aircraft was not completely warmed up so a low to medium speed taxi was initiated.

Moderate throttle was applied to about 10-15" MP and 1500-2000RPM. Full forward elevator was applied so as to lift tail from the ground.

As the aircraft taxied onto the ice crust, the crosswind began to push the aircraft right. The pilot instinctively corrected slightly left to try and keep the aircraft centered on the runway.

As the tail lifted off the runway, the pilot reduced throttle so as to keep the taxi speed slow.

At approximately the same time, the aircraft transitioned to the packed snow, regaining lateral traction. Additionally with the tail elevated, the moderate crosswind and reduced control authority from the now reduced propeller speed allowed the tail to move right notably, increasing markedly the slight left turn already begun on the icy portion of the runway surface.

The pilot attempted to apply right rudder, but did so tentatively and with the reduced control authority it was ineffective in correcting the left turn.

The aircraft continued off the left edge of the runway surface into deep plowed snow at approximately 20-30mph.

With the wind from the left, the left tire initially rode up a little on the deep snow, but the right tire dug in abruptly slowing the aircraft.

As the aircraft pitched forward toward its nose, the right wingtip struck first, then the propeller stuck in the snow, and finally the aircraft completed the forward pitch, impacting primarily on the left wing near the root and at the vertical stabilizer.

Pilot shutoff electrical systems and pulled both throttle and mixture to cutoff.

Pilot then maneuvered such that the restraint could be released without falling and exited the aircraft through the passenger door.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Avoid medium speed tail up taxiing with reduced throttle, especially in moderate crosswind situations.
Increase familiarity with changes in aircraft behavior and control limitations in snowy and icy conditions.
Take precautions to avoid seasonal hazards such as plowed snow which reduces the effective runway width. (snow was plowed to runway width, but grass on edges is usable normally)
