NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On Monday, February 13th, we had flown to near-by neighboring airport KGUR (Guernsey, WY) to obtain fuel prior to a flight lesson. I had a planned flight lesson to be given with George Otis (Otie) Stevenson whose owned aircraft is based at Wheatland Phiefer Field (KEAN), Wheatland, Wyoming. The afternoon's lesson was to include ground reference maneuvers (rectangular course, turns about a point, side slips-following a road). The sky conditions at the time of departure were essentially clear, unlimited visibility, with light winds. Otie was on board as the student pilot in the left seat during the training. I was occupying the right hand front seat as the instructor. Otie's brother, Jay Stevenson, was occupying the left rear seat as an observer. The lesson lasted approximately 1 hour. Upon our return to KEAN (approximately 2:40 pm local) at the completion of our training flight we tuned into KEAN AWOS to pick up the weather for this field. Clear skies remained; however, the wind was now reported as 310 at 13 kts, gust to 19. KEAN has only one asphalt landing strip being runway 8-26. Landing was made into the most prevailing wind direction, that being into the wind on runway 26. I mentally calculated the cross-wind component to be 6 kts. with a potential 4 kt gust. Otie is not at the point in his training where he has been instructed in cross-wind wheel landings. I told him that I would fly the airplane on this landing and demonstrate the landing. He was instructed, by me, to follow through lightly on the controls as I performed the landing and explained what I was doing. The landing approach, landing touchdown, and initial landing rollout were all normal, all on centerline. It took VERY LITTLE bank (5 to 10 deg. est) to manage any drift on final approach. Touchdown was normal, touching down on the right main tire, and then lowering to the left main tire continuing our roll-out on centerline. As we rolled out on our main wheels and as airspeed was normally diminishing, our tail wheel was beginning to settle and it was time to finish bringing it to the ground with the elevator control, just as I have performed hundreds of times. This time was different though. The instant the tailwheel touched the pavement, the aircraft entered a HARD right turn. Instantly I applied left rudder (FULL), and left brake along with right aileron (as the right wing was rising up, and obviously the left wing was going down). The left wing eventually touched the pavement as we were exiting the pavement. Both brakes were used at this point to decelerate. The airplane was on soft ground, and rolled over on its back. None of us were injured.

Jay Stevenson, the observer in the back seat, was videoing our flight and the landing and accident are captured on video.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Post Accident: Tailwheel skid marks left on pavement begin at the point where tailwheel touched down and continue to a point where the plane left the asphalt. This seems to indicate the tailwheel was not rolling freely.

Post Accident: A local A & P Mechanic noticed the left brake pedal went to its lower limit on first depression of the brake pedal. A second depression allowed the brake to hold firmer pressure. This would not allow for the full authority brake response that was needed to bring the nose of the aircraft back parallel with the runway centerline.
