Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Structural damage to both wings, fuselage and vertical stabilizer. No damage to surrounding property.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The launch occurred just before 11 am by aero tow from runway 25 at 1N7. The glider was towed in the direction of the Upper Reservoir on the Kittatinny ridge for some ridge soaring. The release occurred at approximately 3350' MSL a few minutes later. The ridge was working well and the pilot proceeded to go through the motions to test the possibility of ridge soaring on the ridge. After release, the pilot turned SW and found a strong thermal between the Upper Reservoir and Sunfish Pond and used this to climb to about 3500' MSL. After that brief climb, the pilot continued SW to opposite the golf course and was still ridge lift. The pilot then descended to 2000' at the Upper Reservoir to further validate the effectiveness of the ridge lift. The ridge was solid there and the pilot decided to test out the ridge further NE and made it up to Fairview lake before turning back SW.

The pilot did a few more laps on the local ridge, and also climbed in a cloud street to 3500'.

A little after noon, about 1 hour in the flight, the pilot found a nice thermal opposite the golf course and climbed to 3300' and drifted with the wind while climbing. At this point, he felt confident he had enough altitude to make the jump across the Gap, and was on the other side by 2500'. Once there, he then found solid ridge and made good time all the way to Wind Gap. When opposite Cherry Valley Airport, the pilot turned around and headed back towards Blirstown.

As the Gap approached, there were a few thermals and the pilot tried climbing them but never got higher than 2400'. The pilot was attempting to climb to 3000' before making the dash across the Gap. He tried for about 20 minutes, never getting high enough and always falling back on the ridge. At that point he decided to return to Cherry Valley airport and land there. Soon after committing to this decision the ridge lift failed. The pilot thought it was a temporary lull in the wind, and continued to sink towards the trees. He hugged the ridge top as long as he could, then slowly slipped down the side of the ridge. Once in the valley he aimed for a small field (located 1000' SW of the crash site). Instead, he came up short, skirted the lakes and landed at the location indicated at the accident location on this form, at approx 1pm.

He tried to minimize energy as much as possible by slowing the glider before impacting the trees. Then the glider slipped sideways, the left wing hit the ground, and continued to roll over and ended up, upside down.

After friends arrived on the scene, they surveyed the wreck, left it there until the pilot had spoken to the FAA.

Once back in Blirstown, the pilot called the Allentown FSDO and they automatically patched him through to NY, and then transferred him back to Harry. Harry (Allentown FSDO) took down the particulars and gave permission to retrieve the aircraft from the private property. He said he'll come to Blirstown on to look at the wreckage. The pilot waited until he was in Blirstown to make the call because of poor cell phone reception at the crash site. The call was made at 320pm.

RECOMMENDATION (How could this accident/incident have been prevented?)**Operator/Owner Safety Recommendation**

The safety committee of the Aero Club Albatross and the pilot reviewed the flight and believe that better situational awareness of the slight westerly change in the wind was the main contributing factor to this accident. At the Delaware Water Gap where the decision to return to Cherry Valley airport was made, the ridge turns slightly out, making a more northerly wind more favorable. A wind of 290 or 300 is problematic at this section of the ridge, and cannot sustain ridge flight.
