Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The aircraft ground looped and the right wing made contact with the ground, which caused the right wing strut to detach and the right wing to fold outward at the root as the aircraft rolled over onto its right side. The right gear leg also folded inward in the process. The tail section was damaged by the horizontal stabilizer coming into contact with the ground. The vertical stabilizer was damaged by a strap used to pull the aircraft off of the active airstrip. The propeller made contact with the ground during the ground loop and was bent at the tips.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The day began at the aircraft's base (KOAK) and a stop was made at L00, Rosamond Airpark, for food and fuel. At 1633, the aircraft departed for the Chicken Strip, where the occupants were intending to camp for the night. Flight following was obtained en route from Joshua Approach. A climb was made to 8500' MSL in order to clear terrain on course from the south. Following clearance of the ridge into the Saline basin, the pilot began a stabilized approach for a straight-in landing at the Chicken Strip, which he had landed at previously and researched online. At approximately 1000' AGL, the pilot put in full flaps. At approximately 600' AGL, the pilot had visibility of the wind sock at the near end of the runway, which indicated a crosswind from the left of roughly 20-25 degrees. It also appeared that the approach angle was slightly high, and after pulling back the power, the pilot initiated a left forward slip. At approximately 200' AGL, the pilot exited the slip and set up the approach at roughly 5 knots above VSO with the maximum descent angle. Based on prior experience at the strip (of rising terrain to the north), and with knowledge of the power limitations of the aircraft, it had been determined that a go-around once the wheels were down would be undesirable, if not hazardous. The approach angle allowed touchdown roughly 40' down the strip, but the pilot failed to add power in the flair and bounced the landing. After the bounce, the pilot attempted to maintain directional control, but a gust weathervaned the aircraft nose left and caused the right wheel to dig into the gravel during the second touchdown, which accelerated into the ground loop and led to the right wing encountering the ground followed by the rolling over of the fuselage.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The pilot should have considered that the length of the strip (1350') was adequate for adding enough power to roll straight from the flair in order to prevent both the bounced landing and loss of control. The pilot had constructed an internal narrative regarding the safety of a go around which led to mental interference with the act of flying the aircraft according to intuitive experience. The pilot could have potentially prevented the accident by questioning the relevance of the narrative to the task at hand, rather than letting this construct dictate the flying of the aircraft.
