Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Large goose hit LH horizontal stabilizer causing large tear and hole in front of stabilizer. Possible bent spar in horizontal stabilizer.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I was nearing the end of an uneventful IFR flight from KSEE to KSLC in good weather. My assigned routing was:

KSEE
JLI
TRM
TNP
MLF.DELTA4
KSLC
At FL 350

Salt Lake City airport was landing to the south. I was assigned the DELTA FOUR ARRIVAL with the MLF transition. As I executed the SID, I was assigned runway 16R. I was given radar vectors to intercept the 16R localizer and told to keep 210 kts throughout the MLF.DELTA 4 procedure and to maintain 210 kts until that Final Approach Fix BNKER (7.5 DME from I-UAT) on the 16R ILS Approach. Normally, a Citation would be flying a reduced speed during the final approach to the FAF phase of an ILS of 140 to 160 kts (depending on gear up or down) but is capable of 210 kts for traffic considerations (at least until a few miles from glideslope intercept.) ATC instructed to maintain 210 kts and 6000 feet altitude until the FAF. I executed the approach following their instructions with no flaps / no gear for higher speed. Approach flaps cannot be used in a CE-550 until below 202 kts IAS.

The 16R LOC/ILS approach passes over areas with large populations of water fowl. Less than 1 mile from the approach end of 16R lies marshland and the southern end of Farmington Bay of the Great Salt Lake. The ILS 16R approach passes over Farmington Bay between B HIVE (12.6 DME from I-UAT) and the Final Approach Fix at BNKER. The area is wetlands after BNKER up to the northern boundary of KSLC.

Just outside of BNKER, I saw what I thought to be a goose at my same altitude of 6,000 feet (approximately 1,700 AGL). The airplane hit the goose at the ATC assigned speed of 210 kts and 6000 feet. There was a loud sound of impact. I informed ATC immediately of a bird strike with unknown airframe damage to the empennage. They acknowledged and accommodated my request for full runway and no rushing. ATC also called equipment to the runway. The aircraft seemed altered but fully controllable. I continued a visual approach to 16R and landed. There was substantial right rudder required to maintain directional control of the aircraft on short final and landing flare.

After landing, I taxied to TAC Air at SLC and saw substantial damage to the LH horizontal stabilizer.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

An aircraft similar to N551BC encountered water birds near OKC on March 4, 2008 and crashed. The NTSB investigation of the crash of N 113SH correctly points out the formula for Kinetic Energy of $1/2mv^2$; ie, the force of the impact increases as the square of the impact velocity. https://www.nts.gov/news/events/documents/oklahoma_city_ok-2_web_bird_strike_cert_and_damage_john_ocallaghan.pdf

One of the NTSB recommendations is "To remain below demonstrated bird-strike energy, airplane speed must decrease as bird mass increases"

The area to the north of Salt Lake International is a known habitat of large waterfowl including "hundreds of thousands of waterfowl during spring and fall migration." <https://ut.water.usgs.gov/greatsaltlake/birds/>

I do not think that ATC should issue faster than normal approach speeds for a radar approach to the final approach fix when landing to the south only 1,700 feet above an area known for large waterfowl. A bird strike involving a bird of the size of a large goose or pelican could cause a fatal accident at faster speeds when landing to the south at Salt Lake City.

ATC should issue bird advisories and allow reduced approach speeds when birds are observed.

There are four potential runways to accommodate a Citation landing to the south at Salt Lake City. ATC seem to not efficiently distribute landing traffic and found the need to maintain higher approach speeds to accommodate traffic. If ATC had used all four runways more efficiently, there would be less of a need for higher approach speeds over a waterfowl area.
