Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The aircraft sustained propeller damage, engine damage both from striking the runway, the belly of the aircraft sustained sheet metal damage from skidding to stop.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

It was a good clear day with minimal winds in the forecast for mountain flying and I wanted to do some high altitude landings and approach practice today as I had not done much of that. I also wanted to fly some passes and was planned to fly into Granby Airport (KGNB) and then on to Glenwood springs and Leadville in a loop and end with some approach practices out on the plains where the airplane is hangered at Fort Morgan Municipal (KFMM).

I requested a friend ride along for some good discussion and fun as well as to be my safety pilot for the approach practice. We took off from KFMM at approximately 8:20 am, VFR towards KGNB and climbed to 14,500 ft, above the Denver Bravo airspace and then across Rollins Pass, looking for typical mountain flying conditions with light winds. Once through the pass, we turned northwest towards KGNB and descended to pattern altitude. Upon initializing my descend I deployed the landing gear as speed breaks to steepen the descent and get to the pattern altitude at KGNB of 9,000 ft.

We approached the airport at a 45-degree angle to the downwind leg of runway 9, made a base turn and proceeded to land. During this process, the approach had excess speed and I decided that my touchdown point was a bit too far down the runway, so I initiated a go-around. I lifted the nose, added power and retracted the landing gear for another landing attempt. I climbed to 9,000 ft again and turned downwind. We experienced some light turbulence and then turned base and final using flaps and power as a normal descent. We didn't realize the gear was not down until the first propeller blade struck the ground. The plane skidded to a stop and we immediately turned off fuel, master switch and exited the plane. I simply forgot to check if the gear was down on the second landing attempt.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

By executing a short final check list again after go-around. This could have also been prevented by visually insuring that the landing gear was extended upon application of full flaps.
