Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Main landing gear crushed, nose gear crushed, firewall appears to be bent, propeller tips bent, right wing tip crushed, rear wind shield fractured, rear tail section underside crushed.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

After completing a normal descending base to final turn, established on final, the student slowly began to arrest the descent and established level flight. Airspeed began to deteriorate to approximately 68 to 70 kts. On short final I instructed the student to "pitch down" to maintain a target airspeed of 75 kts. The student did not respond. A second command was given to "pitch down," and the student did not respond. At this point the airspeed was in the lower 60s and I followed with another immediate command to "pitch down now" while simultaneously pressing forward on the yoke. As I pressed forward on the yoke, the student pulled with equal force on the yoke. I was taken back by the negative response. I immediately grabbed the yoke while simultaneously pushing forward on the yoke with greater force than my previous attempt and stating "my plane." My push forward was met with an equal if not greater negative response.

I immediately ascertained two options; first I determined we had plenty of altitude to recover and land normally if the student immediately stopped with the negative input (i.e.) pulling back on the yoke, second, add power and attempt a go around. While the previous options were going through my head I again said "George, give me the airplane." I did not receive a positive response and again determined we had plenty of altitude to recover although it was quickly diminishing and any attempt to add power (additional energy) to an already unstable situation was not the best choice given the additional scenarios additional power (more energy) would present. The last airspeed I saw was 58 kts.

I continued to wrestle the controls with the student in an attempt to minimize what was inevitably going to be a hard landing. We hit the ground hard, the nose wheel hitting the asphalt at the beginning of the threshold. The student after impact added full power for whatever reason is not clear to me. We bounced back into the air while the engine clearly did not develop full power. We then hit the grassy area to the right of runway 27 impacting the gear, tail and eventually the right wing tip which almost put us into a cartwheel. The plane came to rest in the grassy area right of runway 27.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I have played this scenario of events over and over in my head for the last couple of days and I don't see anything that would have tipped me off that I would or could experience this type of behavior. On the contrary, the student displayed in just about every facet exemplary knowledge and understanding of the subject material. At this time I don't have an answer as to what I should have done, could have done, or would recommend be done in the future to prevent an incident like this from occurring again.
