Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Tail boom (fuselage) broken, left horizontal stabilizer broken, some damage to L and R ailerons, canopy broken

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On June 14, 2017, I was attempting to fly my new (to me) LAK-12 glider when this accident occurred. I had flown it without incident 4 times before. For this flight, the weather was perfect, almost no wind, no clouds, great visibility. In the early part of the tow, everything seemed fine, I was having no problems. This glider requires that you start the tow with negative flaps until aileron control is achieved, which happens somewhere around 30 knots. At that point you move the flap control from the -1 position to the +1 position, as a result of which the glider transitions to flight. All this happened as it had before. A few seconds after that point I was distracted and glanced into the cockpit for some reason (I don't know what). When I looked back up I was what I would guess was around 100 feet above the towplane. I corrected with a bit of stick forward, but the tow hook released on its own, what is called a back-release. I am told that at about that same time the rope was released by the towplane. Contrary to what I had briefed myself to do, I turned to the left. I was not nearly high enough to accomplish a successful return to the runway, and at about 150 degrees of turn, the left wingtip contacted the ground in about a 45 degree bank. This resulted in a fairly quick rotation of a further 90 degrees or so and the other wing and fuselage impacted into the sagebrush, sliding sideways, and dissipating energy as it went. At some point the canopy exploded, mostly outward. After checking myself for major injuries, I called on the radio and said that it was alright, and then unstrapped and climbed out through the broken canopy. I found that the fuselage was broken and twisted just behind the wing roots. One aileron had a sagebrush branch stuck in the hinge interface. One side of the horizontal stabilizer has a break in the top surface, but no hole in the bottom, so I assume that there is major structural damage there. The wings both appear intact, but I can't see the bottom surface so I don't know about their structural integrity.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Pay attention to my own checklist, particularly the Emergency Plan portion. Plan my flight, including emergencies, then fly my plan.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No
