Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

After the accident, the aircraft appeared totally destroyed. I think a metering light post to the freeway on ramp was sheared off.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I think it was my 6th flight of the day. I started the flight with about 12 gallons of fuel. I took off from San Martin airport around 0445 local time on 4/24/2017. It was a VFR flight with flight following. The plan was to land at San Martin Airport.

The takeoff and the parachute drop was uneventful. The drop was made over San Martin airport at 10,500 ft MSL. I started my left turning spiraling descent after the drop. Moments after after I started my spiraling descend I heard and felt the engine start quiet down as if it was shutting down. I automatically thought I was running low on fuel, so I started making my turns in the opposite direction after I made sure fuel selector was in both position. That solved the engine problem. I didn't want to keep turning to the right because cylinder head temperature started to go down too low, so I switched to making left turns. I think this fuel starvation due to banking happened two more times.

When the fuel starvation issue came back one final time, banking in the opposite direction didn't solve the issue. I assumed the plane was almost out of fuel so I was flying left downwind pattern for RWY 14 really high (probably 4000 ft at abeam midfield). When I was flying the downwind, I pushed the mixture full forward and adjusted the throttle to see if the engine was producing any power. From the sound, I determined the engine wasn't producing much power, so I was attempting power off landing. The glide was looking good for the high altitude and the pattern I was flying to make it back to the runway until I was short final.

On short final it felt like the engine went more quiet and prop was almost stopping. This is when I realized I wasn't going to make it the runway. If I continued straight ahead I wouldn't have made it over the light posts and cables. I determined landing on the on-ramp was the best thing I could do with altitude I had. It was a somewhat hard landing on the road, and the plane hit some posts on the rollout.

After the accident, I secured the engine and evacuated the aircraft. I had few cuts on my face. From what I could tell, the aircraft was leaning against a guard rail near a signal post, and it was severely damaged. All the wreckage seemed to be where the aircraft came to a stop.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

My first recommendation is to never takeoff with just minimum fuel, have extra. Second, bring throttle to idle before making gliding distance judgment because if there is a chance engine might be producing partial power and gliding distance will be overestimated.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

I suspected engine power loss due to fuel exhaustion.
